

# tGW-700 Series

## User Manual

Ver.1.9.2

Tiny Modbus/TCP to RTU/ASCII Gateway

### WARRANTY

All products manufactured by ICP DAS are warranted against defective materials for a period of one year from the date of delivery to the original purchaser.

### WARNING

ICP DAS assumes no liability for damages consequent to the use of this product. ICP DAS reserves the right to change this manual at any time without notice. The information furnished by ICP DAS is believed to be accurate and reliable. However, no responsibility is assumed by ICP DAS for its use, nor for any infringements of patents or other rights of third parties resulting from its use.

### COPYRIGHT

### TRADEMARKS

Names are used for identification purposes only and may be registered trademarks of their respective companies.

### CONTACT US

If you have any questions, please feel free to contact us via email at:

[service@icpdas.com](mailto:service@icpdas.com), [service.icpdas@gmail.com](mailto:service.icpdas@gmail.com)

### SUPPORT

This manual relates to the following modules:

tGW-712, tGW-722, tGW-732

tGW-715, tGW-725, tGW735

tGW-718, tGW-724, tGW-734

tGW-715i

# Packing List

The shipping package includes the following items:

- One tGW-700 series hardware module
- One printed Quick Start Guide
- One software utility CD

## Note:

If any of these items are missing or damaged, please contact the local distributor for more information. Save the shipping materials and cartons in case you need to ship the module in the future.

# 1. Introduction

## Modbus TCP/UDP Master to Modbus RTU/ASCII Slave

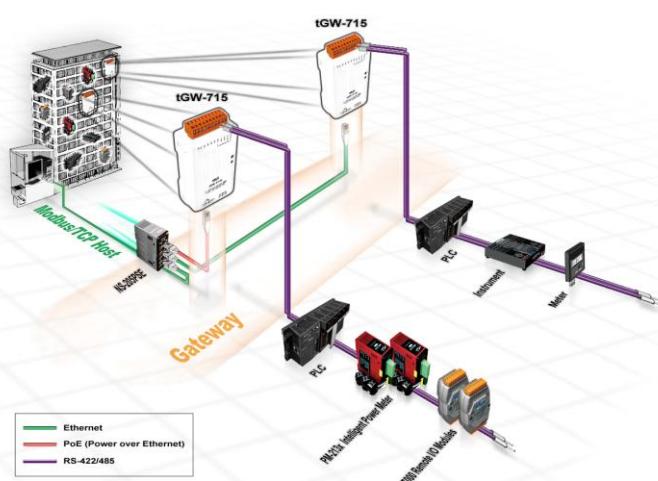

## Modbus RTU/ASCII Master to Modbus TCP/UDP Slave

Modbus has become the de facto standard protocol for industrial communication, and is now the most commonly available means of connecting industrial electronic devices. Modbus allows for communication between many devices connected to the same RS-485 network, for example, a system that measures temperature and humidity and communicates the results to a computer. Modbus is often used to connect a supervisory computer with a remote terminal unit (RTU) in supervisory control and data acquisition (SCADA) systems.

The tGW-700 module is a Modbus TCP/UDP to RTU/ASCII gateway that enables a Modbus/TCP host to communicate with serial Modbus RTU/ASCII devices through an Ethernet network, and eliminates the inherent cable length limitations of legacy serial communication devices. The module can be used to create pair-connection applications (as well as serial-bridge or serial-tunnel applications), and can then route data over a TCP/IP connection between two serial Modbus RTU/ASCII devices, which is useful when connecting mainframe computers, servers or other serial devices that use Modbus RTU/ASCII protocols and do not themselves have Ethernet capability.

In harsh industrial environments, the tGW-700 series (for i version) also adds 2500 V<sub>DC</sub> and +/- 4 kV ESD protection component that diverts the potentially damaging charge away from sensitive circuit to protects the module and equipment from the sudden and momentary electric current.

The tGW-700 module features a powerful 32-bit MCU that enables efficient handling of network traffic, and also has a built-in web server that provides an intuitive web management interface that allows users to modify the configuration of the module, including the DHCP/Static IP, the gateway/mask settings and the serial port settings

### Low Power Consumption

The tGW-700 module offers true IEEE 802.3af-compliant (classification, Class 1) Power over Ethernet (PoE) functionality using a standard Category 5 Ethernet cable to receive power from a PoE switch, such as the NS-205PSE. If there is no PoE switch on site, the module will also accept power input from a DC adapter. The tGW-700 module is designed for ultra-low power consumption, reducing the hidden costs resulting from increasing

fuel and electricity prices, especially when a large number of modules are installed. Reducing the amount of electricity consumed by choosing energy-efficient equipment can also have a positive impact on maintaining a green environment.

### ■ Comparison of Device Servers:

Series Features	PPDS	PDS	DS	tDS	tGW
<b>Virtual COM</b>	Yes	Yes	Yes	Yes	-
<b>Programmable</b>	Yes	Yes	-	-	-
<b>PoE</b>	Yes	-	-	Yes	Yes
<b>Modbus Gateway</b>	Yes	-	-	-	Yes
<b>Multi-client</b>	About 20 Sockets			1 Sockets/Port	10 Sockets/Port
<b>Remarks</b>	Professional	Powerful	Isolation for DS-715	Cost-effective, Entry-level	Cost-effective, Entry-level

## 1.1 Ethernet Solutions

Nowadays, the Ethernet protocol has become the foremost standard for local area networks. Connectivity via the Internet is now common in many of the latest applications from home appliances, to vending machines, to testing equipment, to UPS, etc. An Ethernet network can link office automation and industrial control networks, access remote systems and share data and information between machines from multiple vendors, and also provides a cost-effective solution for industrial control networks.

## 1.2 Web Server Technology

Web server technology enables the tGW-700 to be configured via a standard web browser interface, e.g. Google Chrome, Internet Explorer, or Firefox, etc. This means that it is easy to check the configuration of the tGW-700 via an Ethernet network without needing to install any other software tools, thereby reducing the learning curve required for maintaining the device.

								2-wire RS-485 4-wire RS-422			
COM2		-	5-wire RS-232	3-wire RS-232	-	2-wire RS-485	2-wire RS-485	-	5-wire RS-232	3-wire RS-232	
COM3		-	-	3-wire RS-232	-	-	2-wire RS-485	-	-	3-wire RS-232	
Self-Tuner		-	Yes, automatic RS-485 direction control								
RS-485	Bias Resistor	-	Yes, 1 KΩ								
	Node	-	254 (max.)								
UART		16c550 or compatible									
Isolation		-	-	-	2500 V <sub>DC</sub>	-	-	-	-	-	
ESD Protection		-	-	-	+/-4 kV	-	-	-	-	-	
<b>COM Port Format</b>											
Baud Rate		115200 bps Max.									
Data Bit		5, 6, 7, 8									
Parity		None, Odd, Even, Mark, Space									
Stop Bit		1, 2									
<b>Power</b>											
Power Input		PoE: IEEE 802.3af, Class 1 DC jack: +12 ~ 48 V <sub>DC</sub>									
Power Consumption		0.07 A @ 24 V <sub>DC</sub>									
<b>Mechanism</b>											
Connector		Male DB-9 x1	10-Pin Removable Terminal Block x 1								
Mounting		DIN-Rail									
Flammability		Fire Retardant Materials (UL94-V0 Level)									
<b>Environment</b>											
Operating Temperature		-25 ~ +75 °C									
Storage Temperature		-30 ~ +80 °C									
Humidity		10 ~ 90% RH, non-condensing									
<b>Note:</b> COM1/COM2/COM3 = TCP Port 502/503/504											

## 2.2 Features

- Supports Modbus TCP/UDP master and slave
- Supports Modbus RTU/ASCII master and slave
- Max. connections (masters) per serial port: 32 (tGW-71x), 16 (tGW-72x) or 10 (tGW-73x)
- Read-cache ensures faster Modbus TCP/UDP response
- Supports UDP responder for device discovery (UDP Search)
- Static IP or DHCP network configuration
- Easy firmware update via the Ethernet (BOOTP, TFTP)
- Tiny Web server for configuration (HTTP)
- Contains a 32-bit MCU that efficiently handles network traffic
- 10/100 Base-TX Ethernet, RJ-45 x1 (Auto-negotiating, auto MDI/MDIX, LED Indicators)
- Includes redundant power inputs: PoE (IEEE 802.3af, Class 1) and DC jack
- Allows automatic RS-485 direction control
- 2500 V<sub>DC</sub> isolation and +/- 4 kV ESD protection for i versions
- Male DB-9 or terminal block connector for easy wiring
- Tiny form-factor and low power consumption
- RoHS compliant with no Halogen
- Cost-effective Modbus Gateway

## 2.3 Applications

- Factory Automation
- Building Automation
- Home Automation
- Remote Diagnosis and Management

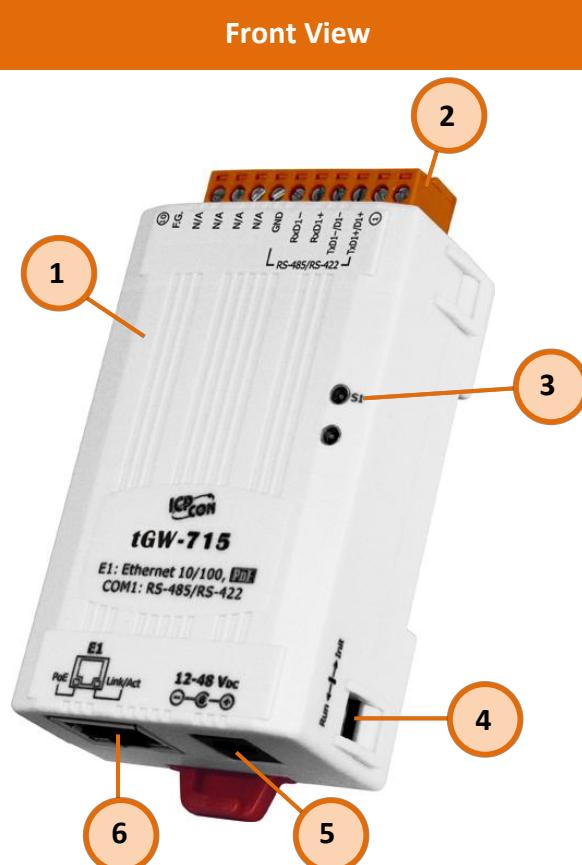

## 2.4 Selection Guide

Model	CPU	Ethernet	Baud Rate	COM1	COM2	COM3
tGW-712	32-bit MCU	10/100 Base-TX, PoE	115200 bps	5-wire RS-232	-	-
tGW-722				5-wire RS-232	5-wire RS-232	-
tGW-732				3-wire RS-232	3-wire RS-232	3-wire RS-232
tGW-715				2-wire RS-485 4-wire RS-422	-	-
tGW-715i				Isolated 2-wire RS-485 4-wire RS-422	-	-
tGW-725				2-wire RS-485	2-wire RS-485	-
tGW-735				2-wire RS-485	2-wire RS-485	2-wire RS-485
tGW-718				3-wire RS-232 2-wire RS-485 4-wire RS-422	-	-
tGW-724				2-wire RS-485	5-wire RS-232	-
tGW-734				2-wire RS-485	3-wire RS-232	3-wire RS-232
3-Wire RS-232: RxD, TxD, GND 5-Wire RS-232: RxD, TxD, CTS, RTS, GND 2-Wire RS-485: DATA+, DATA-, GND 4-Wire RS-422: TxD+, TxD-, RxD+, RxD-, GND						

## 2.5 Appearance

### 1. Robust Insulated and Fire-retardant Case

### 2. Serial COM Ports

The number of serial COM Ports available depends on the type of tGW-700 module. For more detailed information regarding the pin assignments for the Serial COM ports, refer to [Section 2.6 Pin Assignments](#).

### 3. S1: System LED indicator

Once power is supplied to the tGW-700 module, the system LED indicator will illuminate. An overview of the LED functions is given below:

Function	System LED Behavior
Running Firmware	Steady ON
Network Ready	Slow flashing – Once every 3 seconds
Serial Port Busy	Rapid flashing – Once every 0.2 seconds

### 4. Operating Mode Switch

**Init Mode:** Configuration mode

**Run Mode:** Firmware operation mode

For tGW-700 series modules, the operating mode switch is set to the **Run** position by default. In order to update the firmware for the tGW-700 module, the switch must be moved from the **Run** position to the **Init** position. The switch must be returned to the Run position after the update is complete.

**5.****+12 to +48 V<sub>DC</sub> Jack:**

The tGW-700 is equipped with a +12 V<sub>DC</sub> to +48 V<sub>DC</sub> jack that can be used to connect a power supply. If no PoE switch is available on site, a DC adapter can be used to power the tGW-700 module.

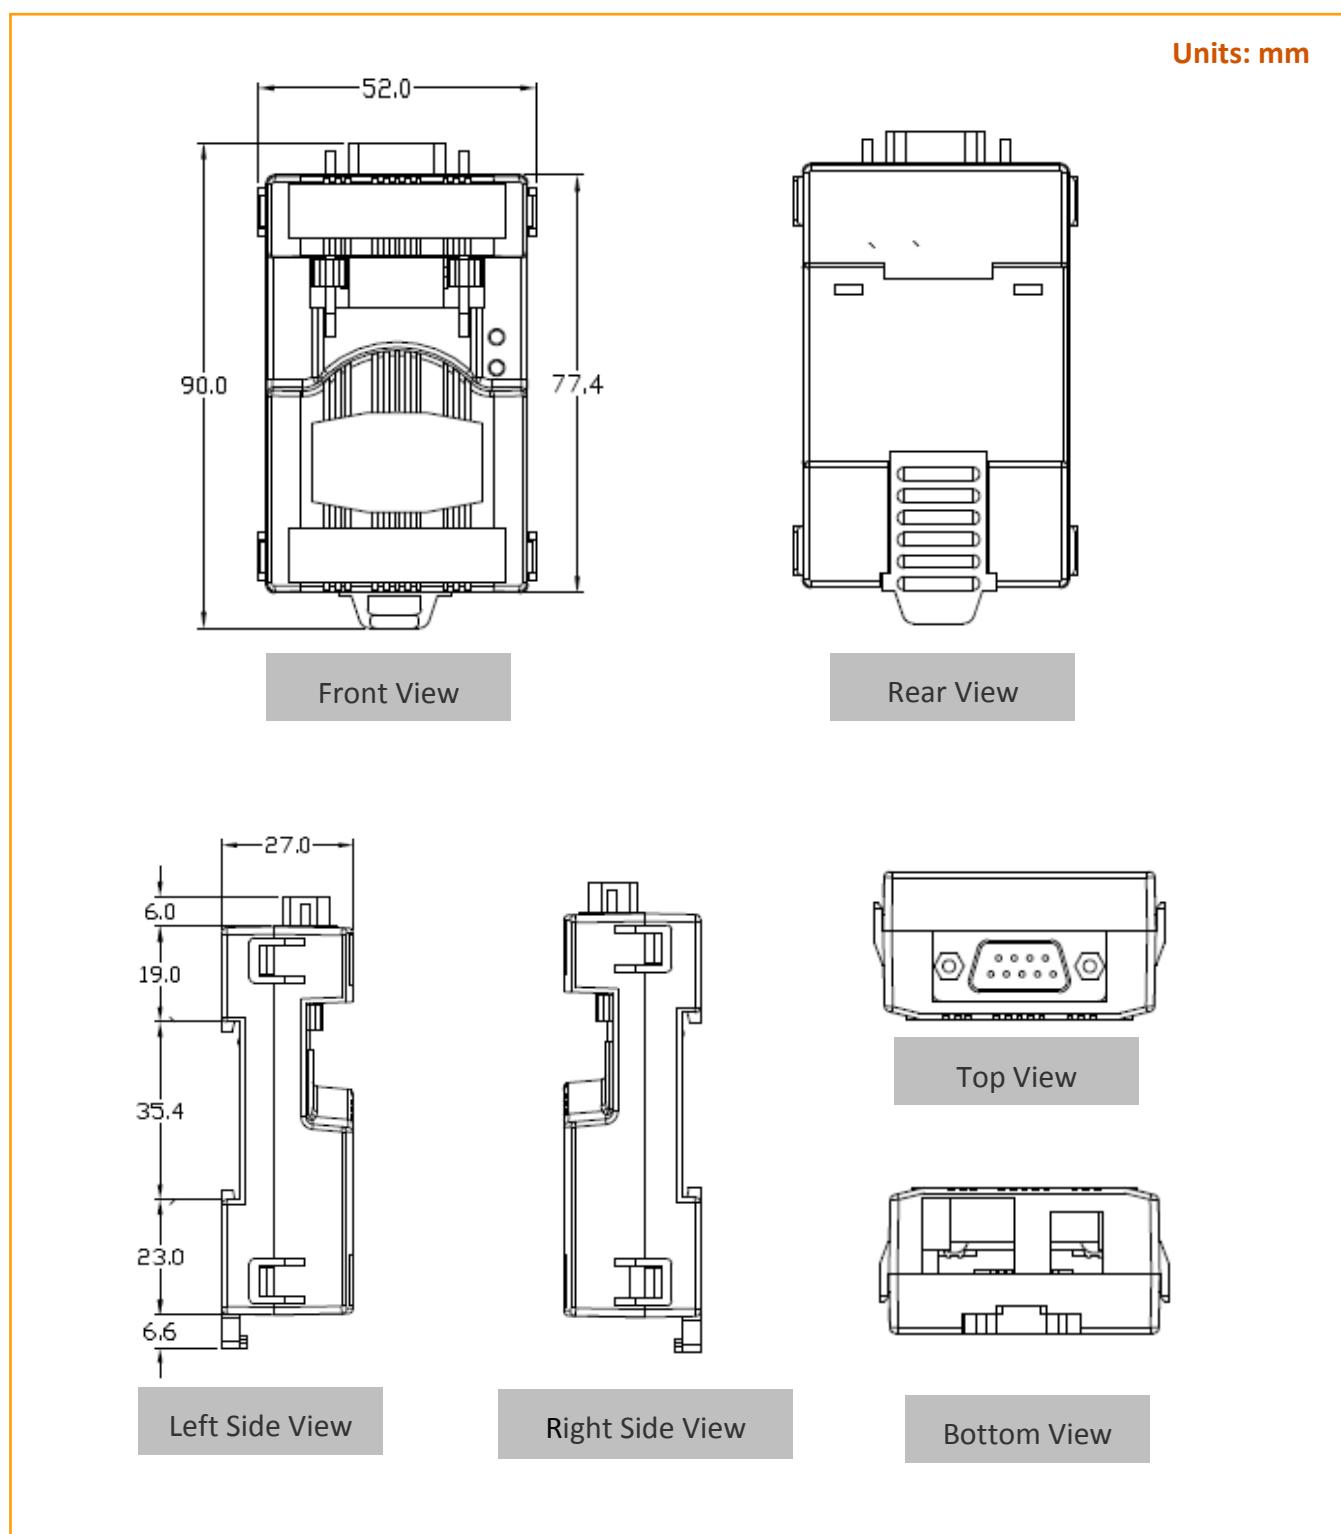

**6.****PoE and Ethernet RJ-45 Jack**

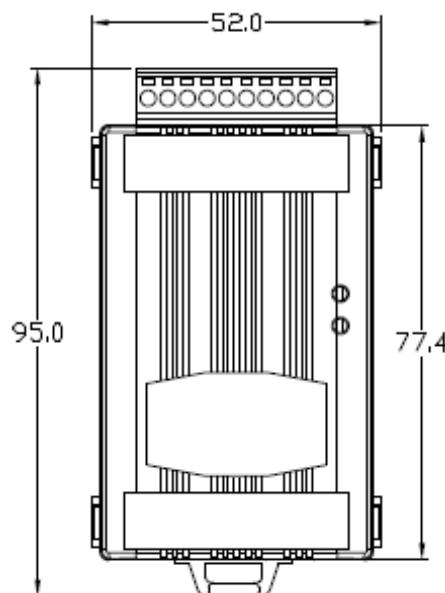

The tGW-700 module is equipped with an RJ-45 jack that is used as the 10/100 Base-TX Ethernet port and features networking capabilities. When an Ethernet link is detected and an Ethernet packet is received, the **Link/Act LED (Orange)** indicator will be illuminated. When power is supplied via PoE (Power-over-Ethernet), the **PoE LED (Green)** indicator will be illuminated.

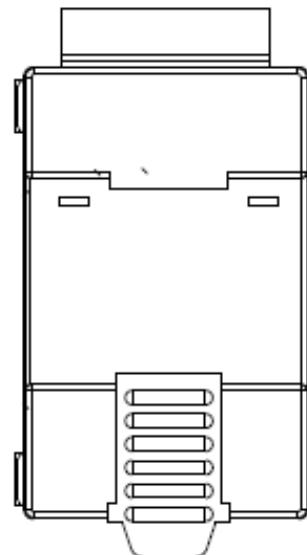

## 2.6 Dimensions

## 2.7 Pin Assignments

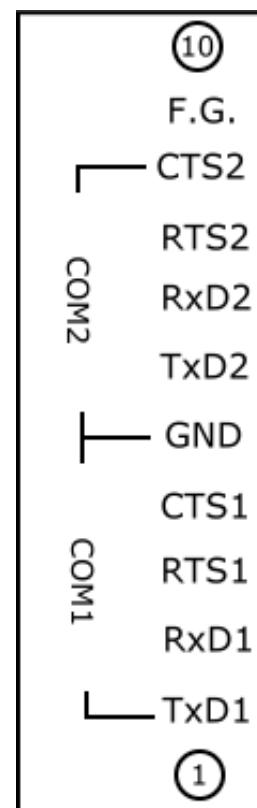

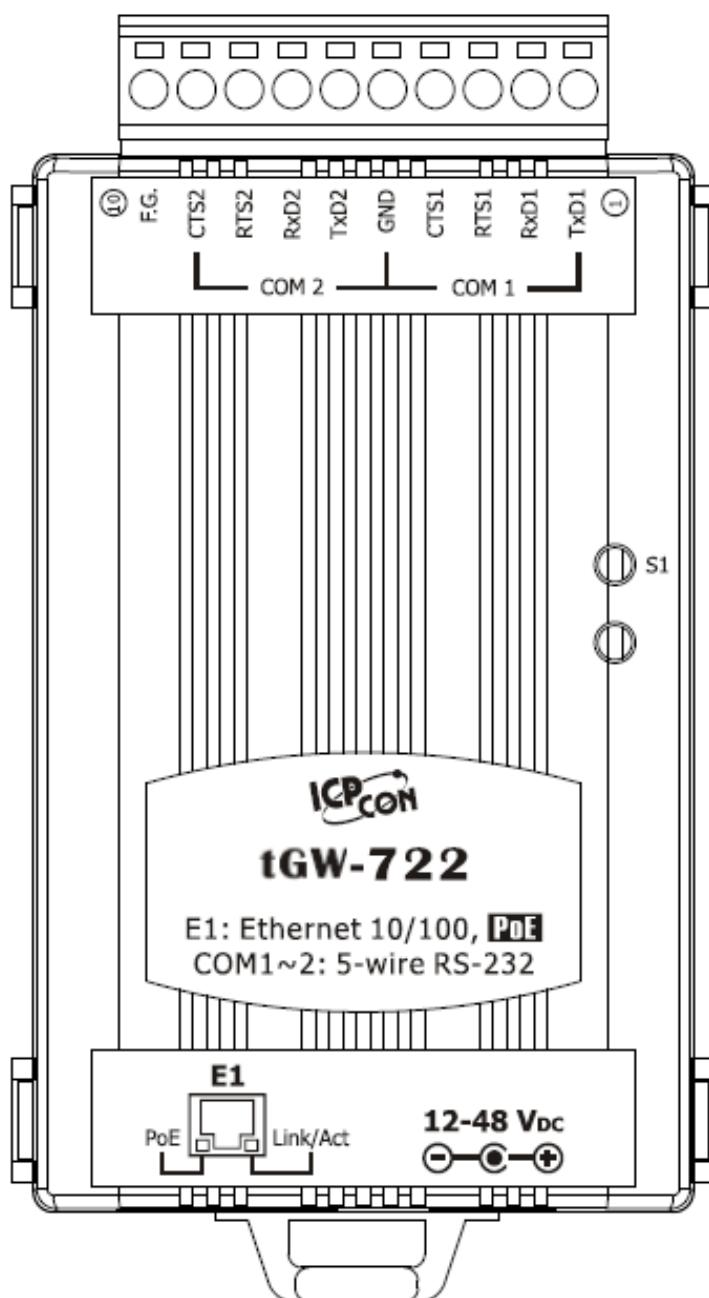

### 2.6.1 tGW-712 (1-Port, 5-wire RS-232 Module)

 **Note:**  
The *CTS* and *RTS* pins are reserved and have no function.

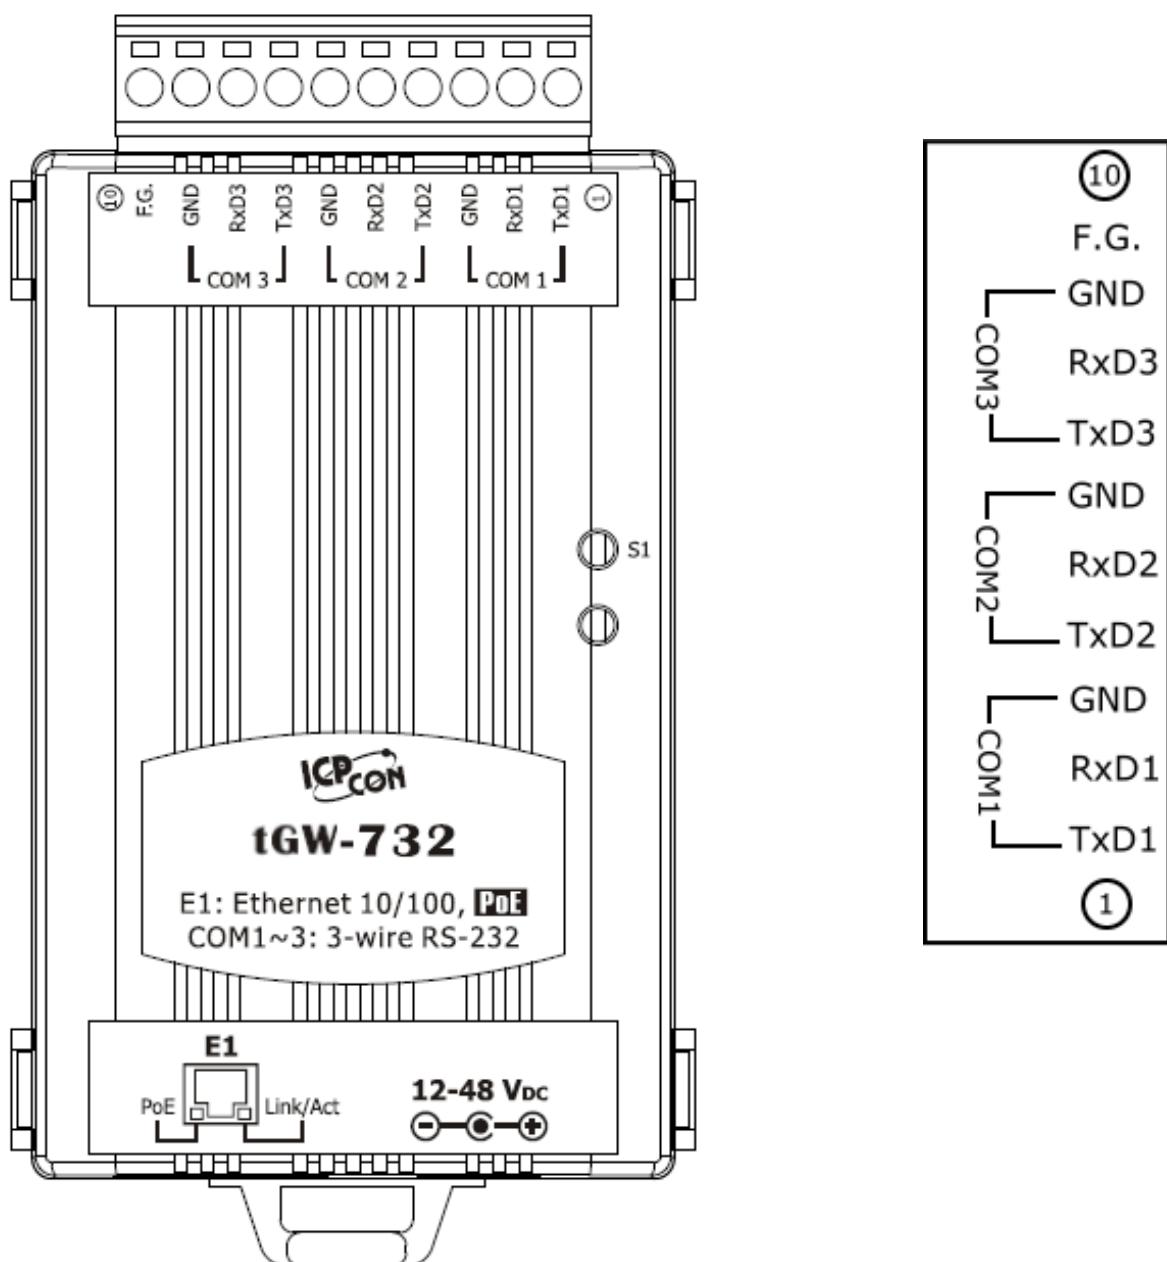

## 2.6.2 tGW-722 (2-Port, 5-wire RS-232 Module)

**Note:**  
The CTS and RTS pins are reserved and have no function.

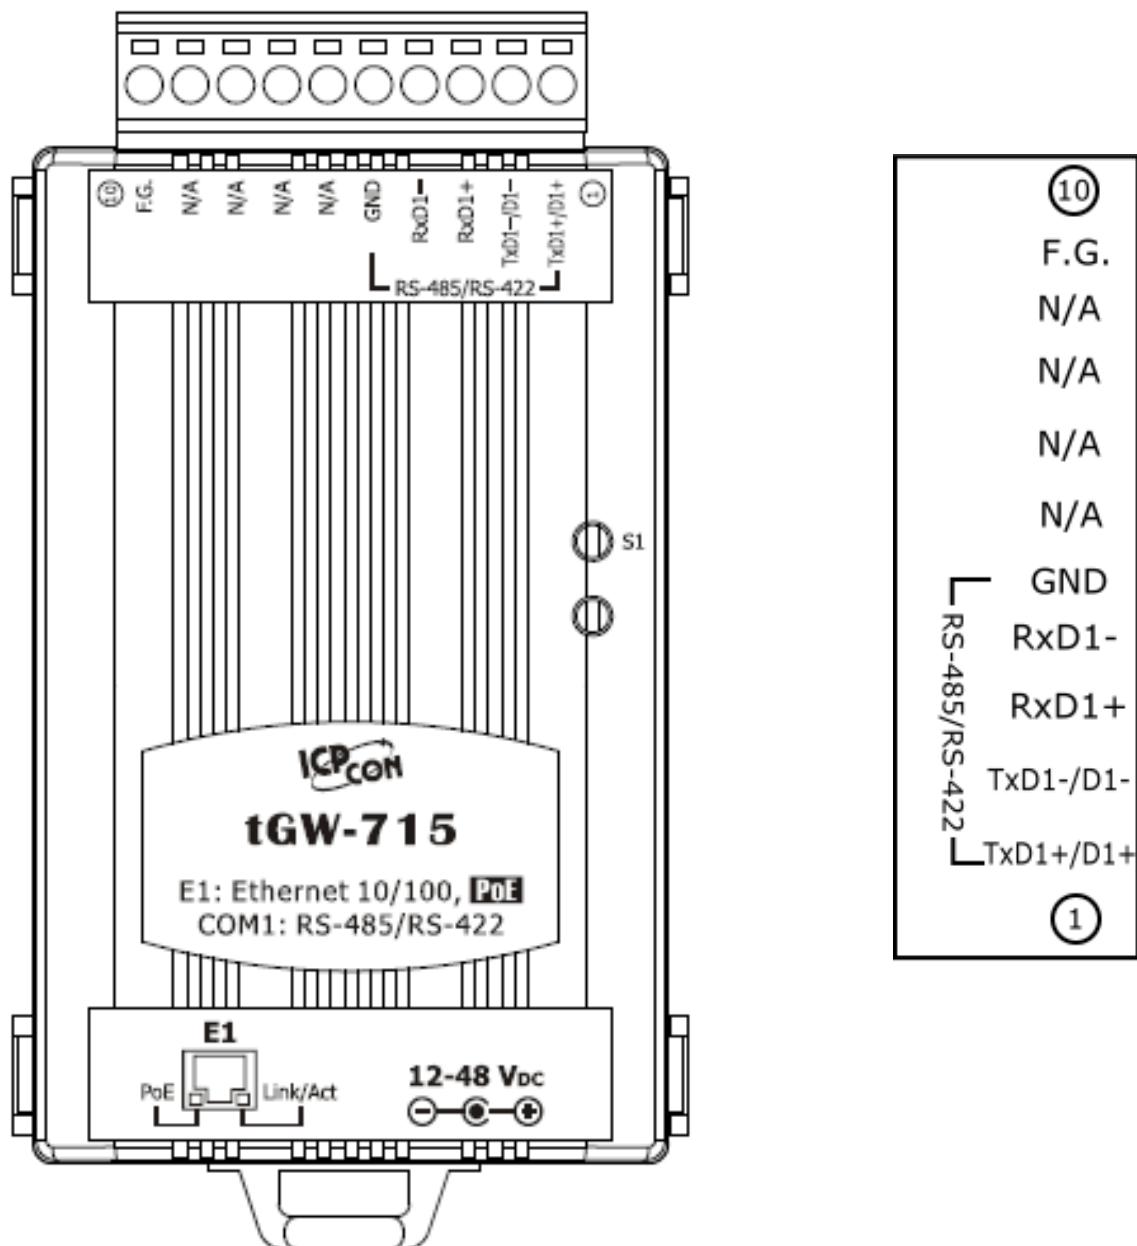

## 2.6.3 tGW-732 (3-Port, 3-wire RS-232 Module)

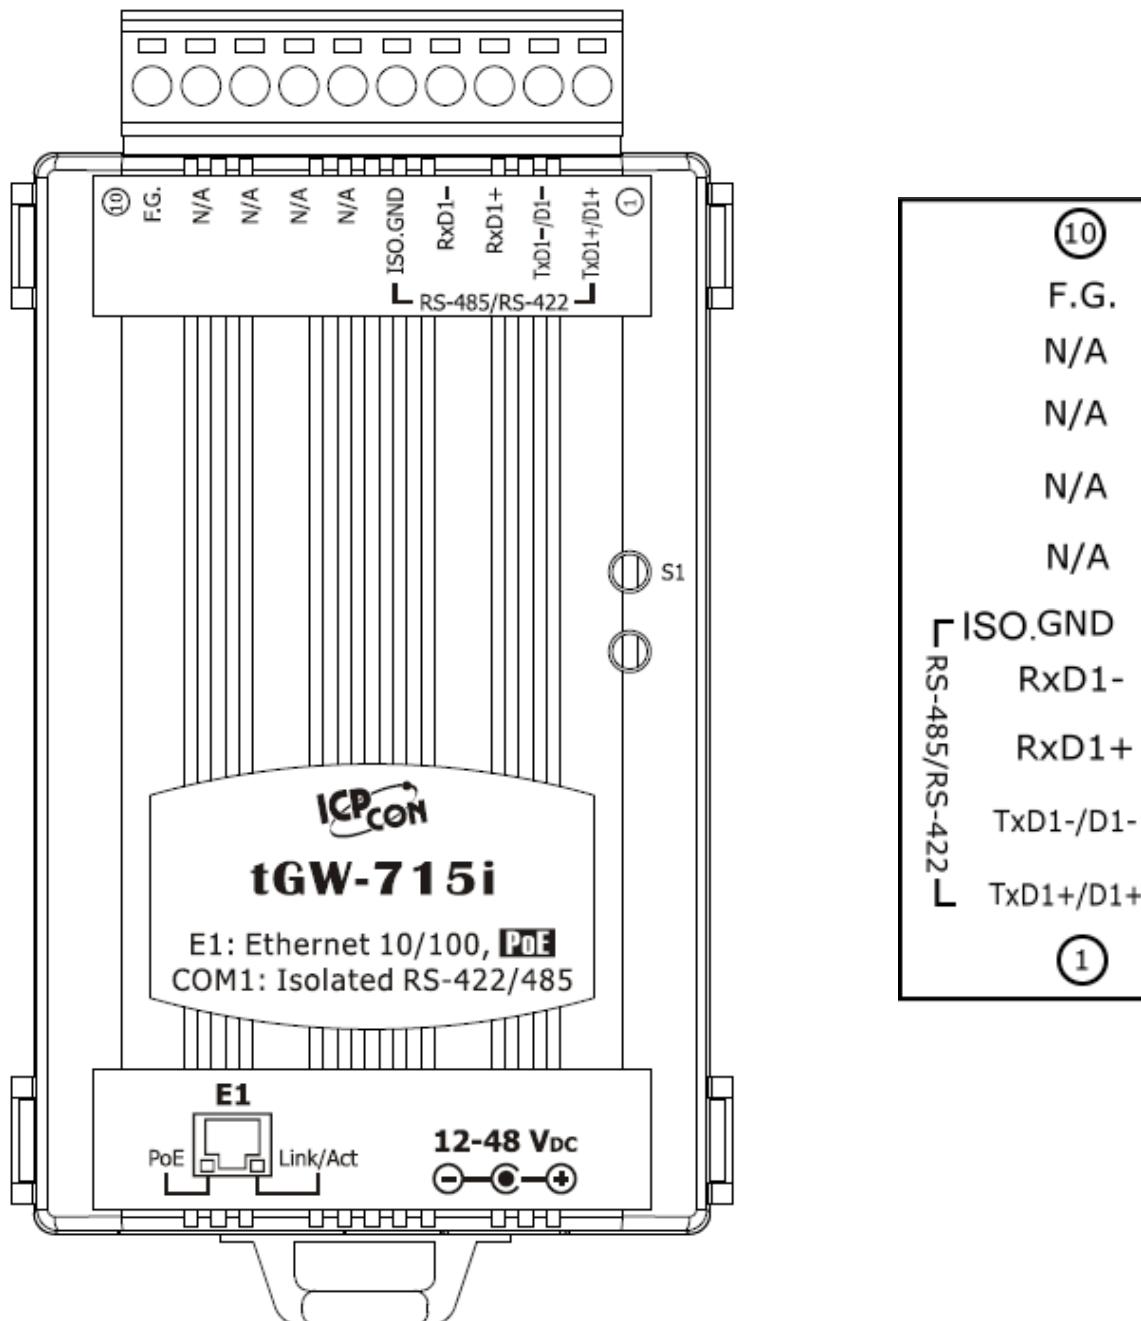

## 2.6.4 tGW-715 (1-Port, 2/4-wire RS-485/422 Module)

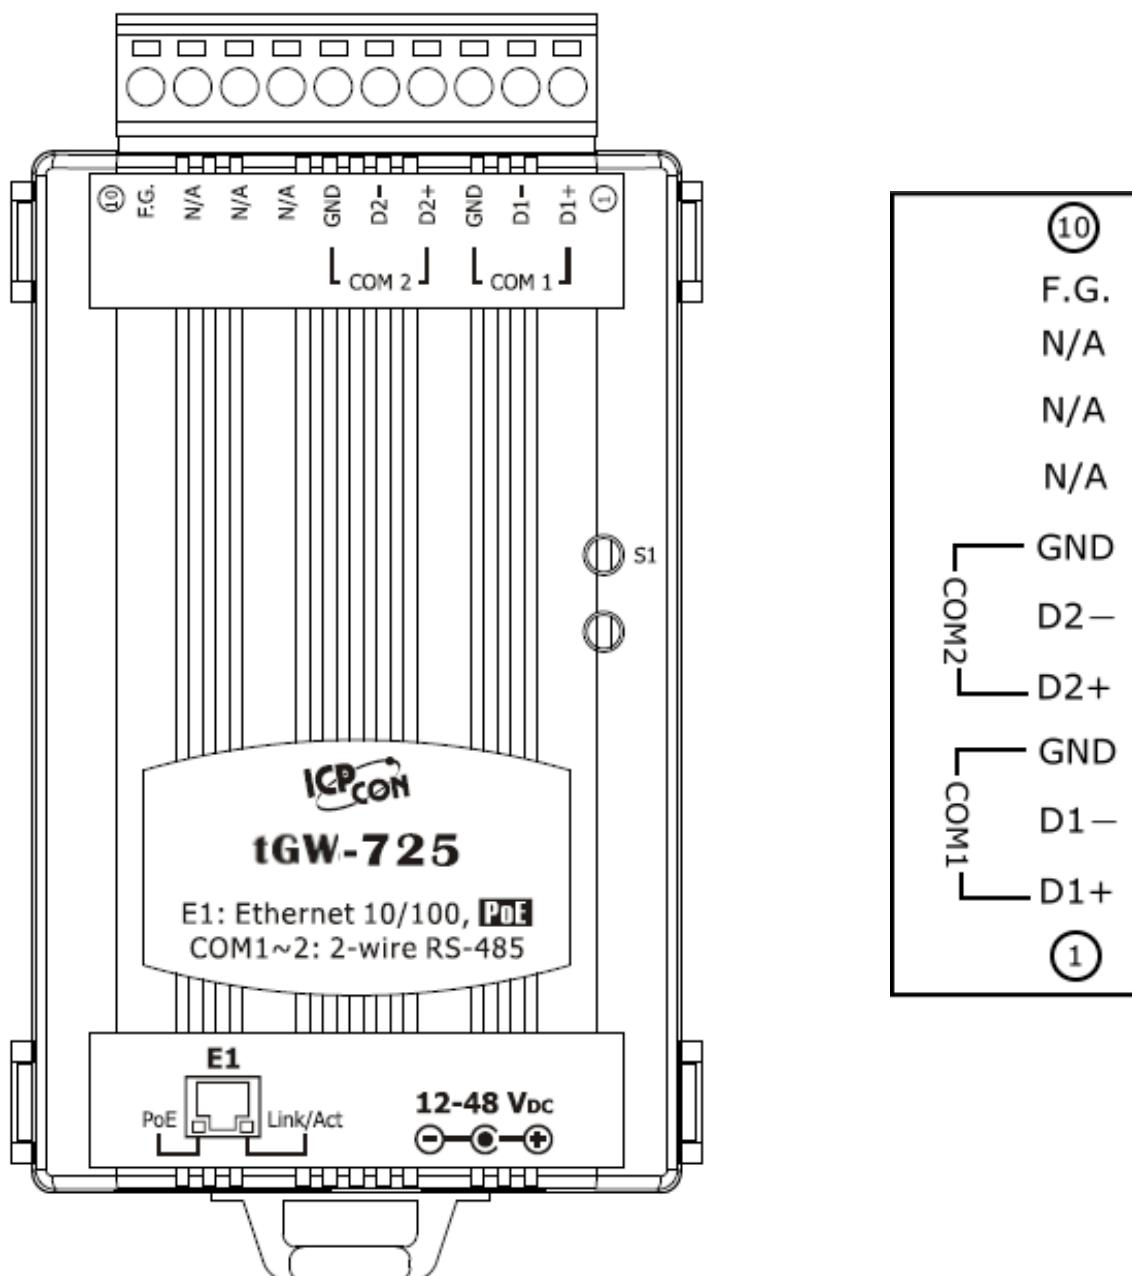

## 2.6.5 tGW-715i (1-Port Isolated 2/4-wire RS-485/422 Module)

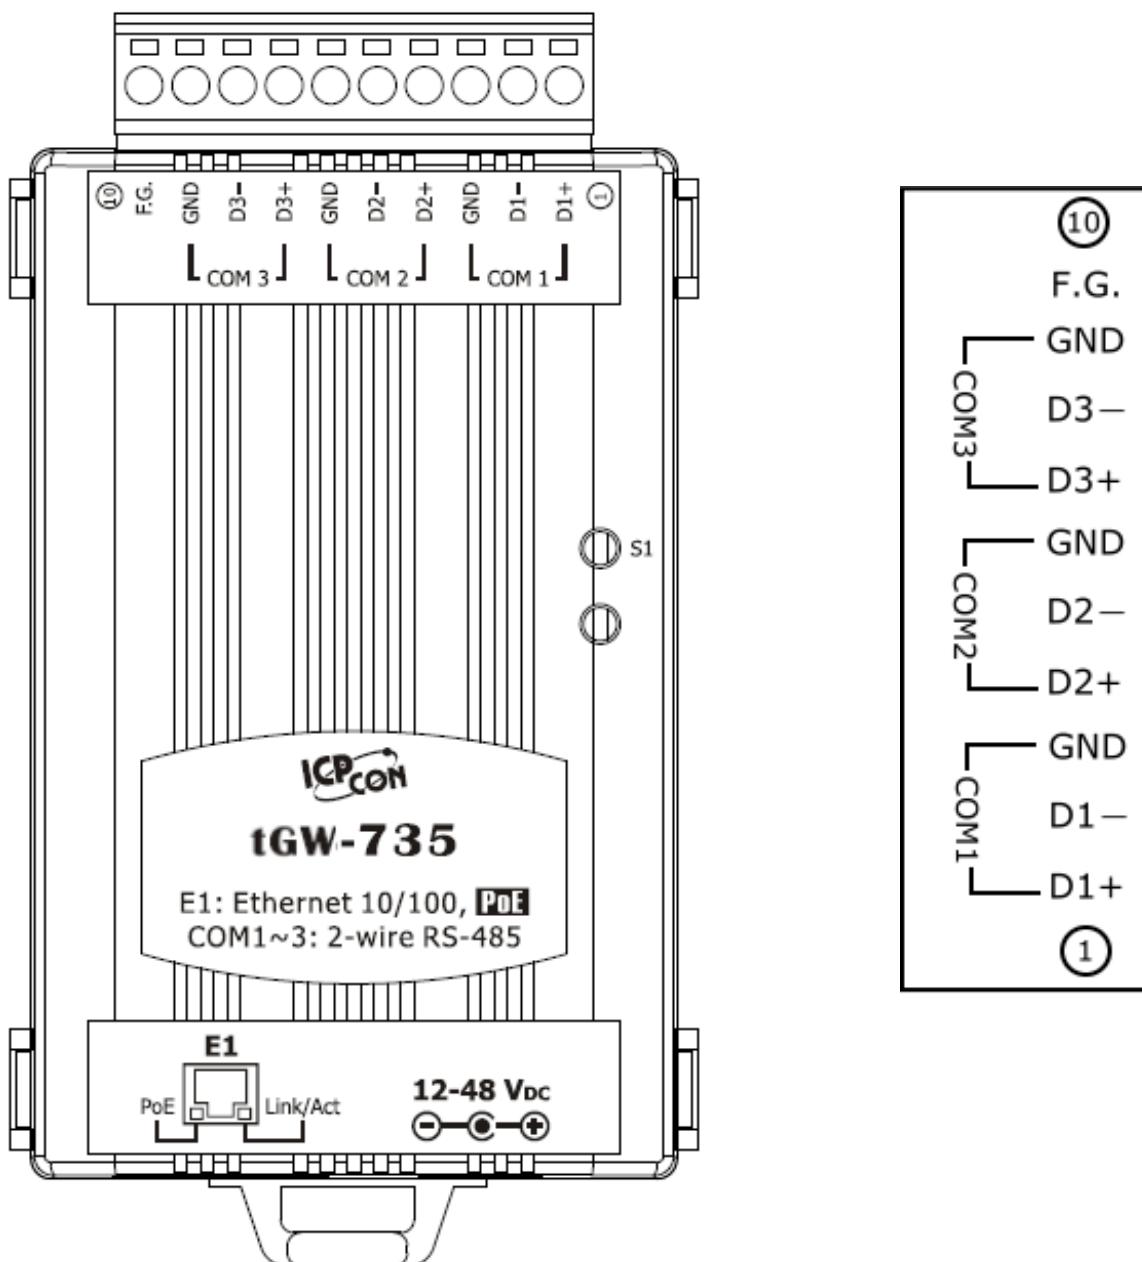

## 2.6.6 tGW-725 (2-Port, 2-wire RS-485 Module)

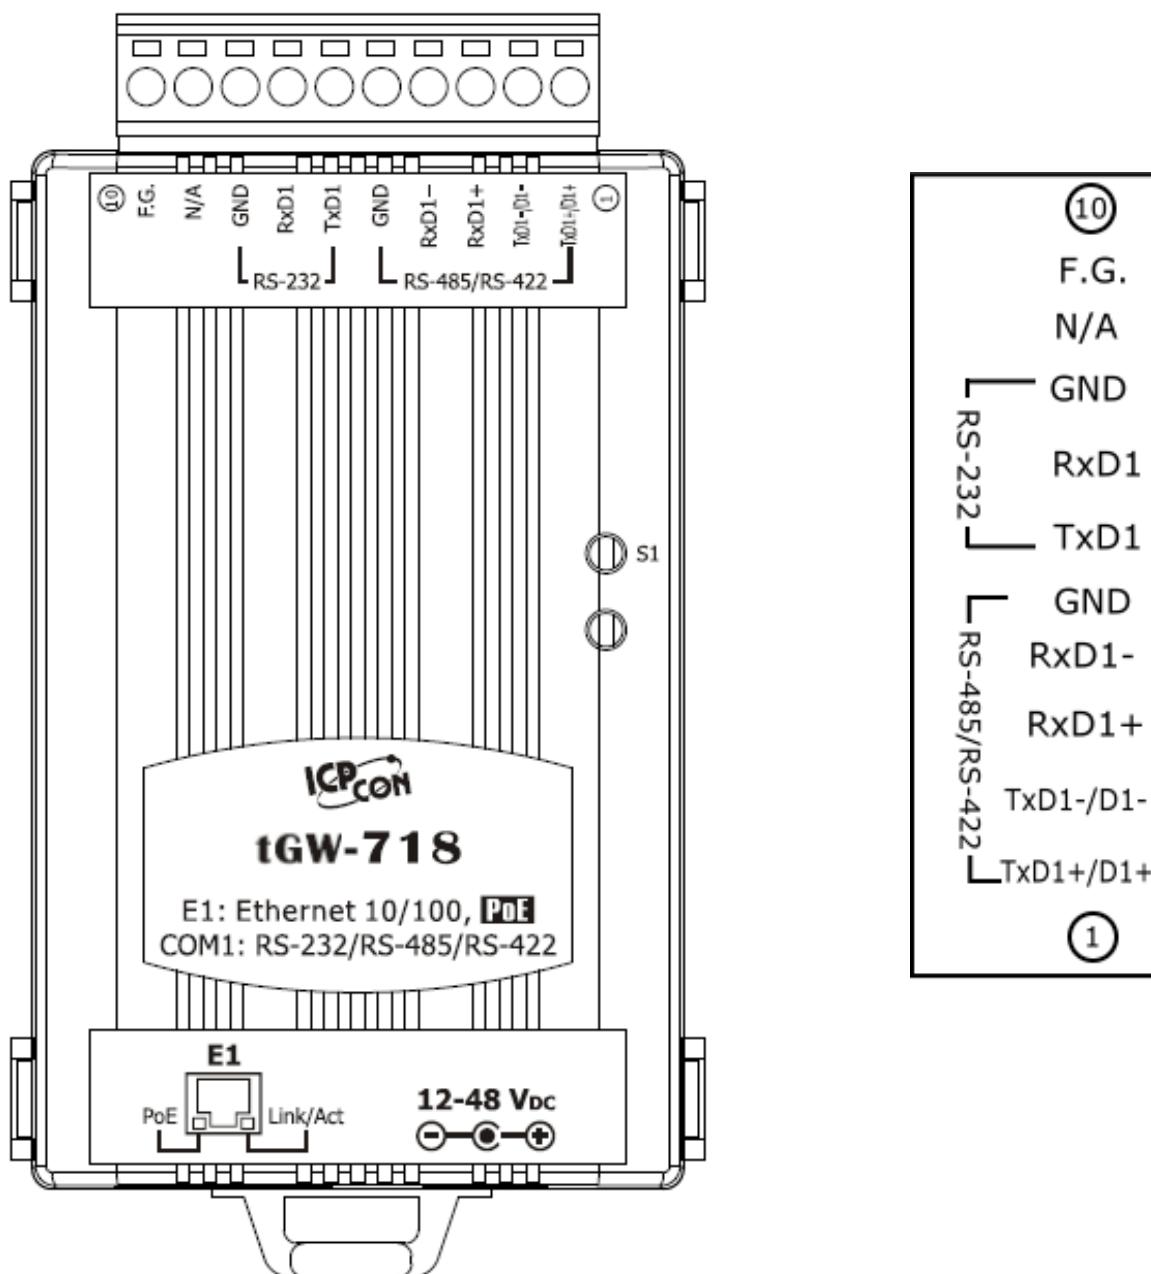

## 2.6.7 tGW-735 (2-Port, 3-wire RS-485 Module)

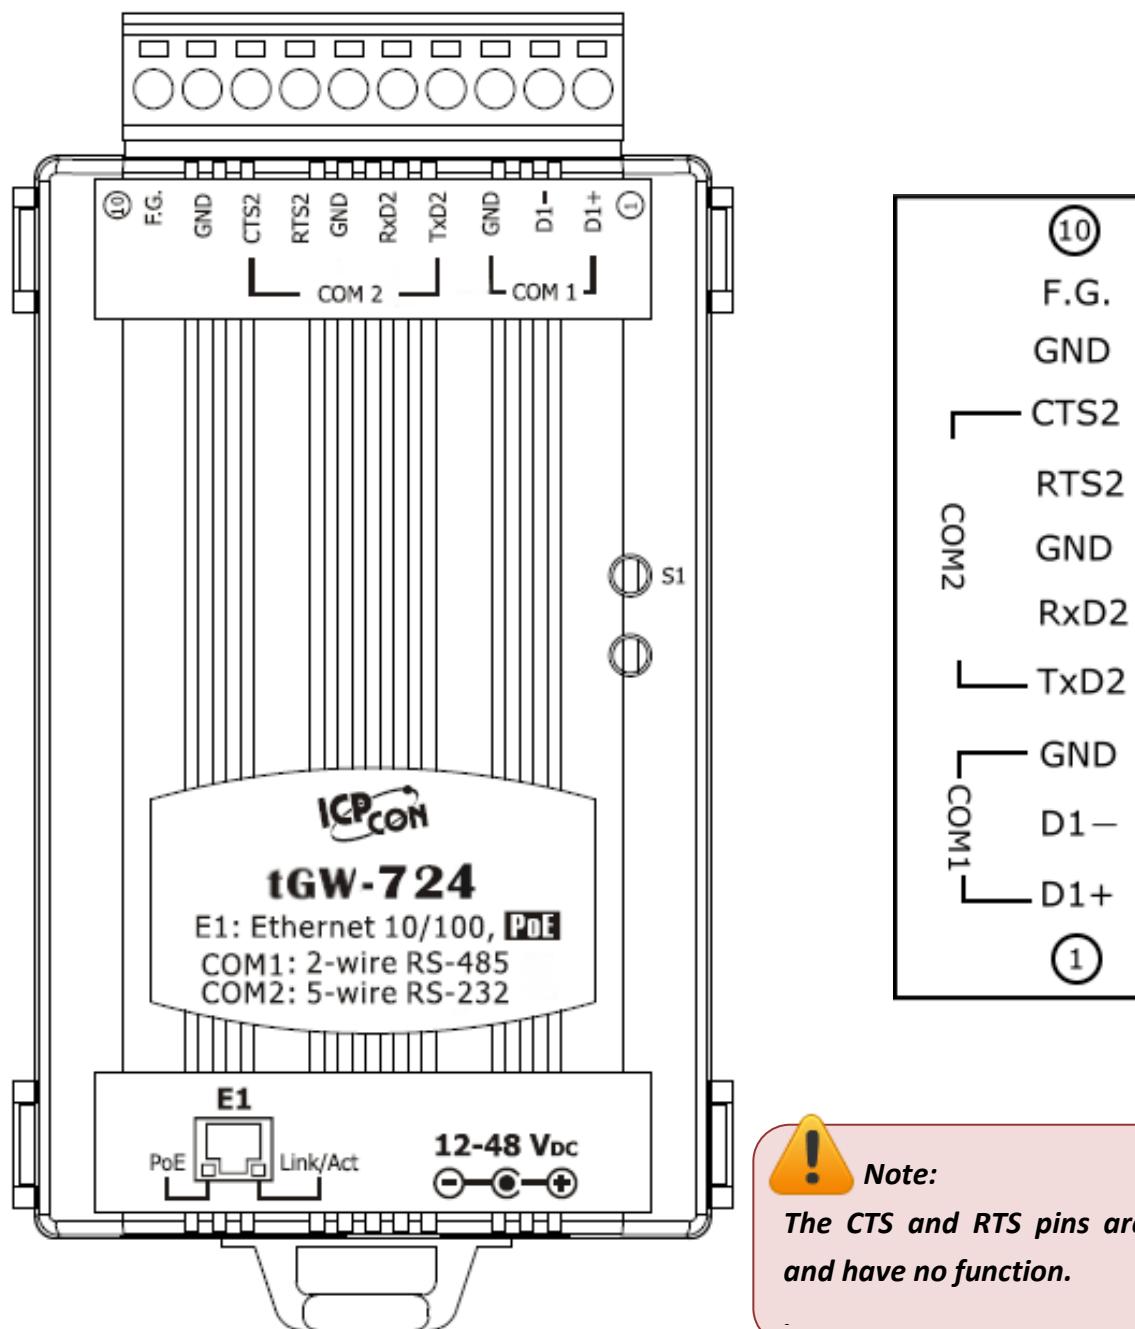

## 2.6.8 tGW-718 (1-Port, 3-wire RS-232 and 2/4-wire RS-485/422 Module)

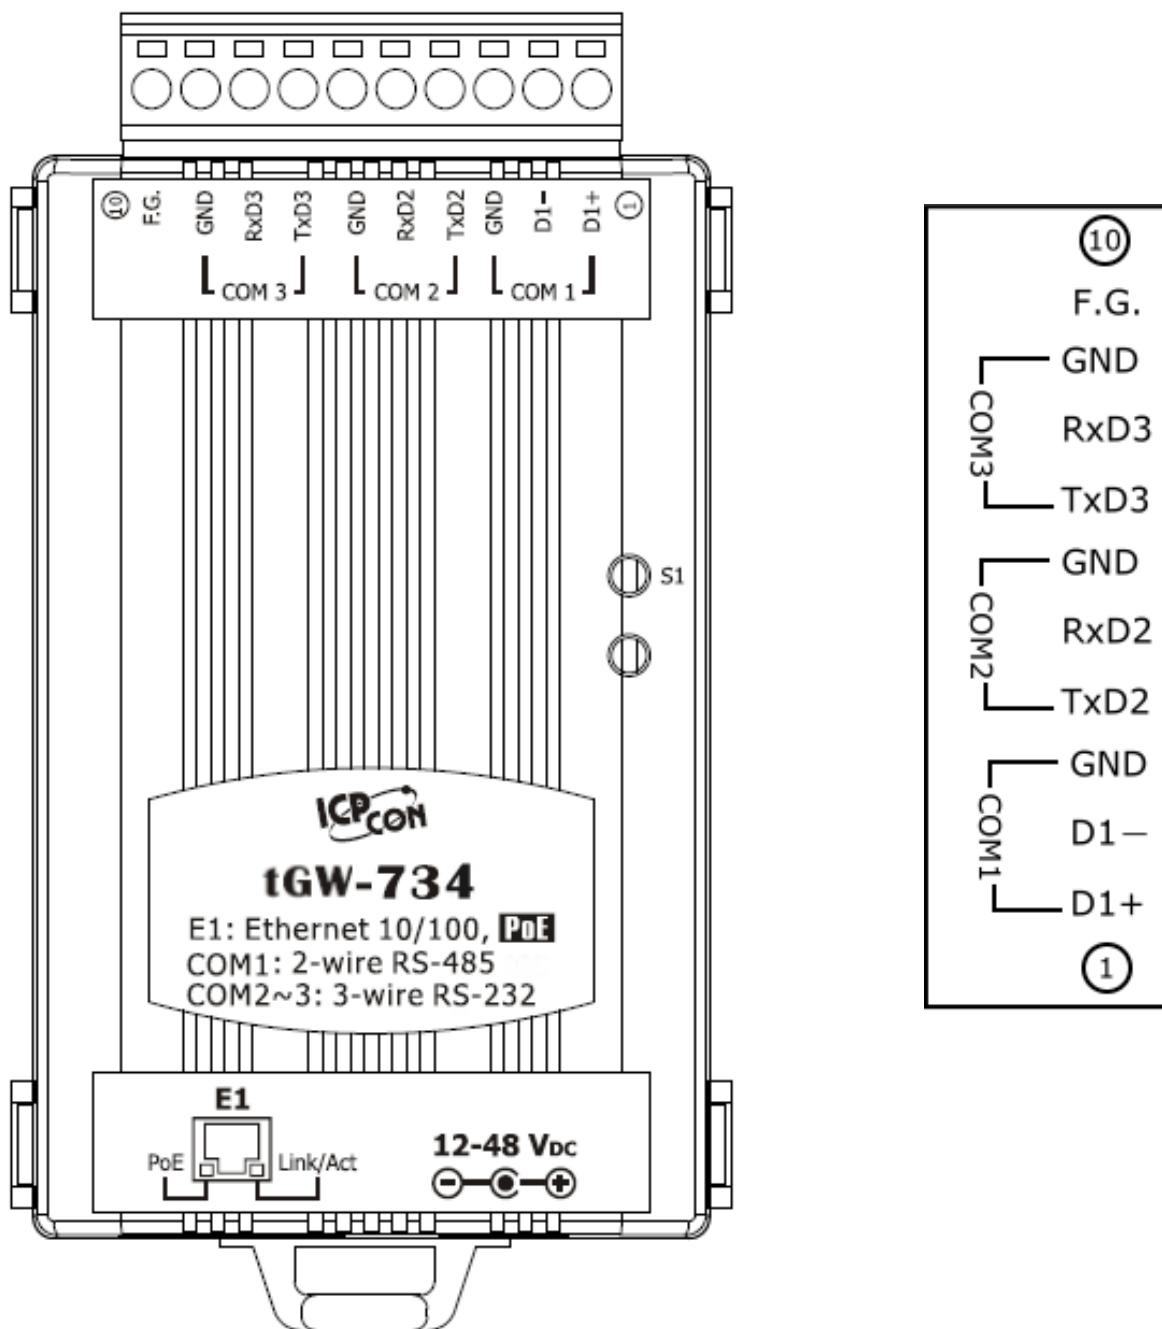

## 2.6.9 tGW-724 (1-Port, 2-wire RS-485 and 1-Port, 5-wire RS-232 Module)

## 2.6.10 tGW-734 (1-Port, 2-wire RS-485 and 2-Port, 3-wire RS-232 Module)

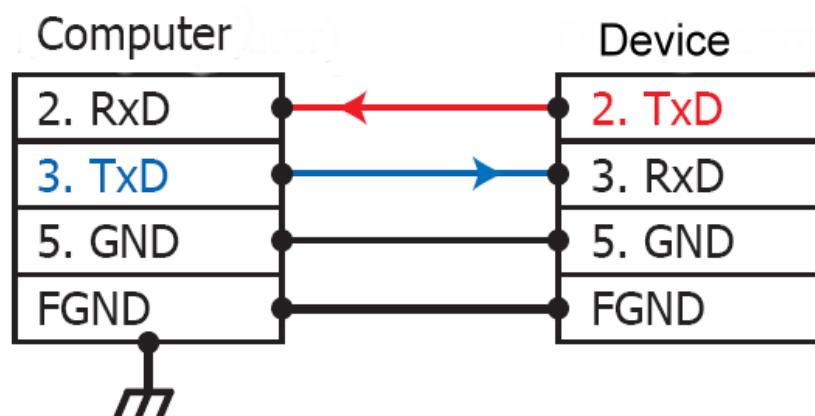

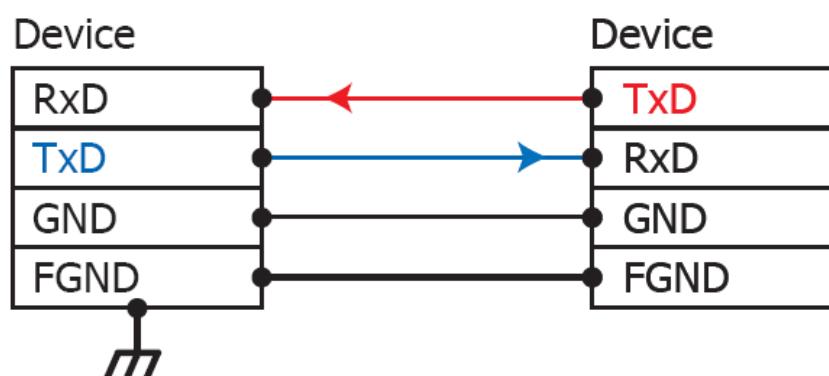

## 2.8 Wiring Notes for RS-232/485/422 Interfaces

### 2.7.1 RS-232 Wiring

#### 5-wire RS-232 Connection (DB-9)

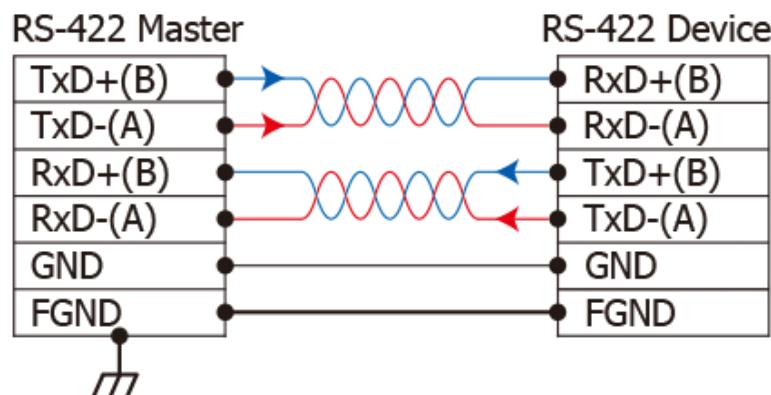

#### 3-wire RS-232 Connection

**Note:**

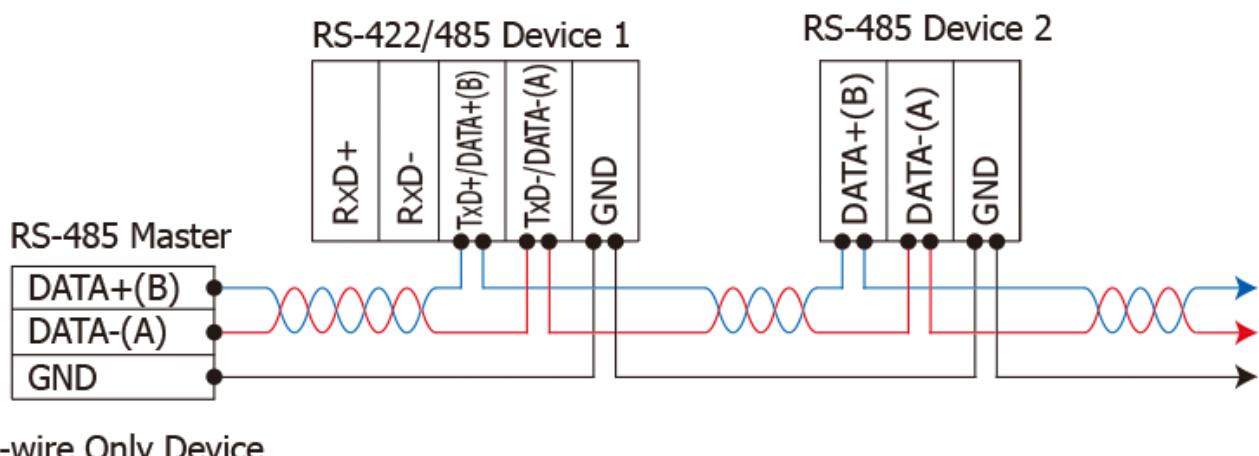

*FGND is the frame ground that is soldered to the metal shield on the DB-9 cable.*

## 2.7.2 RS-422 Wiring

## 2.7.3 RS-485 Wiring

**Note:**

1. *Usually, you have to connect all signal grounds of RS-422/485 devices together to reduce common-mode voltage between devices.*
2. *Twisted-pair cable must be used for the DATA+- wires.*
3. *Both two ends of the cable may require a termination resistor connected across the two wires (DATA+ and DATA-). Typically 120 Ω resistors are used.*
4. *The Data+ and B pins are positive-voltage pins, and Data- and A pins are negative-voltage pins in the above figure. The B/A pins may be defined in another way depending on devices, please check it first.*

### 3. Setting up the tGW-700 Module

This chapter provides detailed information about the “Self-Test” process, which is used to confirm that the tGW-700 series module is operating correctly. Before beginning the “Self-Test” process, the wiring test, Ethernet configuration and search/Modbus utility driver installation procedures must first be fully completed. Follow the procedure described below:

#### Step 1: Connect the Power Supply and the Host PC

1. Ensure that the network settings on your PC are configured correctly.
2. Ensure that the Windows firewall or any Anti-Virus firewall software is correctly configured or temporarily disable these functions; otherwise the “**Search Servers**” function in the eSearch Utility may not work as required. You may need to contact your System Administrator for more details of how to do this.
3. Check that the Init/Run switch is in the **“Run”** position.

Figure 3-1

4. Connect both the tGW-700 and the Host computer to the same sub-network or the same Ethernet Switch, and then power on the tGW-700. Refer to **Figures 3-2 and 3-3** for illustrations of how to do this.

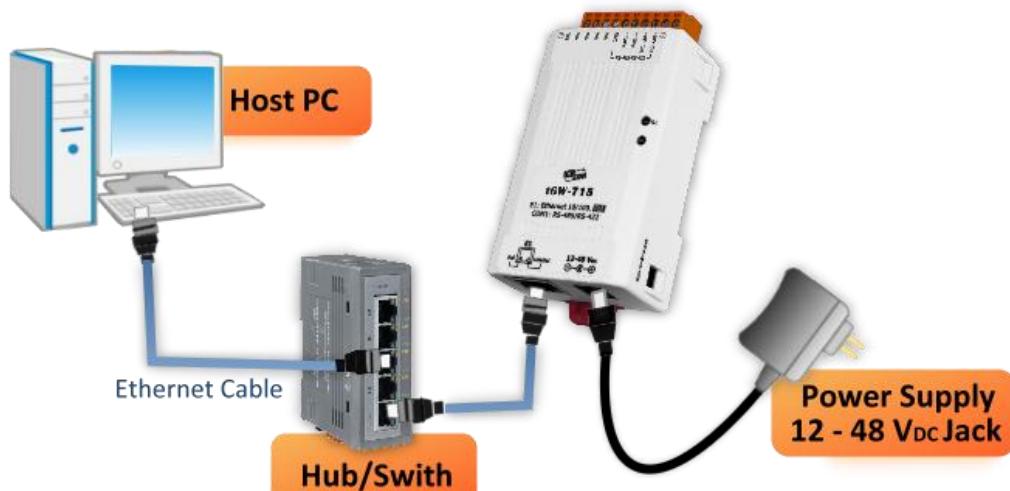

**+12 to +48 V<sub>DC</sub> jack Power Supply (Non-PoE)**

Figure 3-2

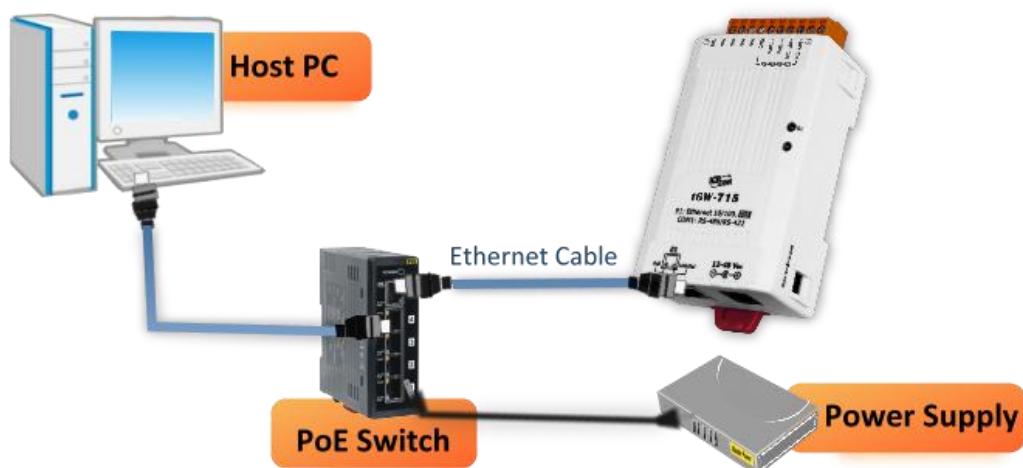

**PoE Power Supply**

Figure 3-3

Figure 3-4

- Verify that the System LED indicator is flashing.

## Step 2: Install the Modbus Utility and the eSearch Utility

The Modbus Utility and eSearch Utility can be obtained from either the companion CD-ROM, the ICP DAS FTP site, or the ICP DAS web site. The location of the install files on the CD and the download addresses are shown below:

### Modbus Utility:

CD:\\ NAPDOS\\Software\\Modbus\_Utility\\

[http://ftp.icpdas.com/pub/cd/tinymodules/napdos/software/modbus\\_utility/](http://ftp.icpdas.com/pub/cd/tinymodules/napdos/software/modbus_utility/)

### eSearch Utility:

CD:\\ NAPDOS\\Software\\eSearch\\

<http://ftp.icpdas.com/pub/cd/tinymodules/napdos/software/esearch/>

### Step 3: Search for the tGW-700 series module on the Ethernet network

1. Open the eSearch Utility and then click the “**Search Servers**” button to search for the tGW-700 module.
2. Once the search process is complete, double-click the name of the tGW-700 module to open the “**Configure Server**” dialog box.

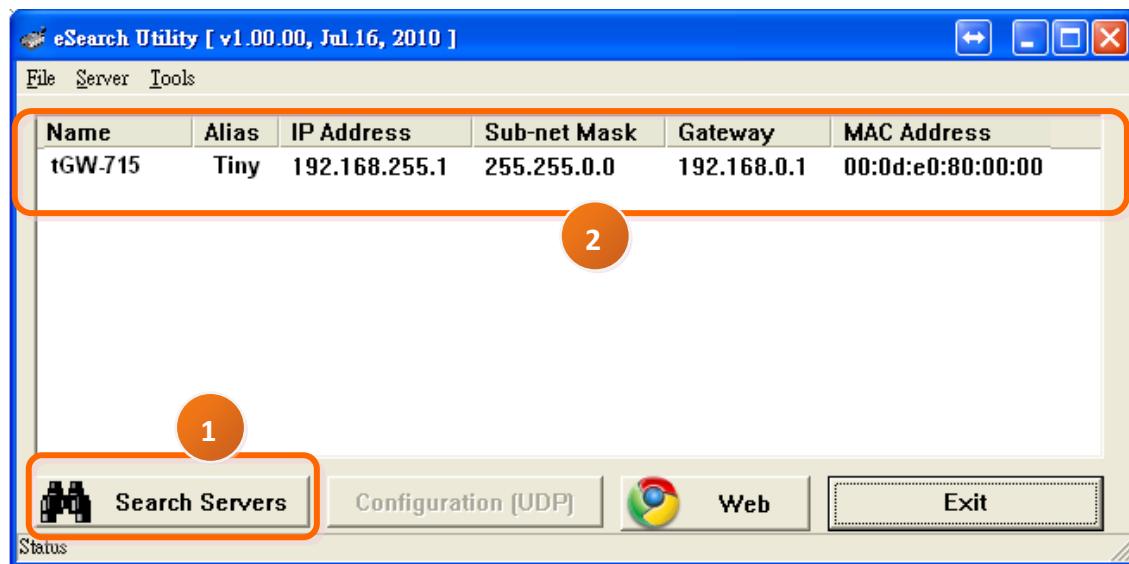

Figure 3-5

3. Enter the network settings information, including the **IP, Mask and Gateway addresses**, and then click “**OK**” button. The new settings for the tGW-700 will take effect within 2 seconds. If you don't know the correct network configuration information, contact your Network Administrator to obtain the details.

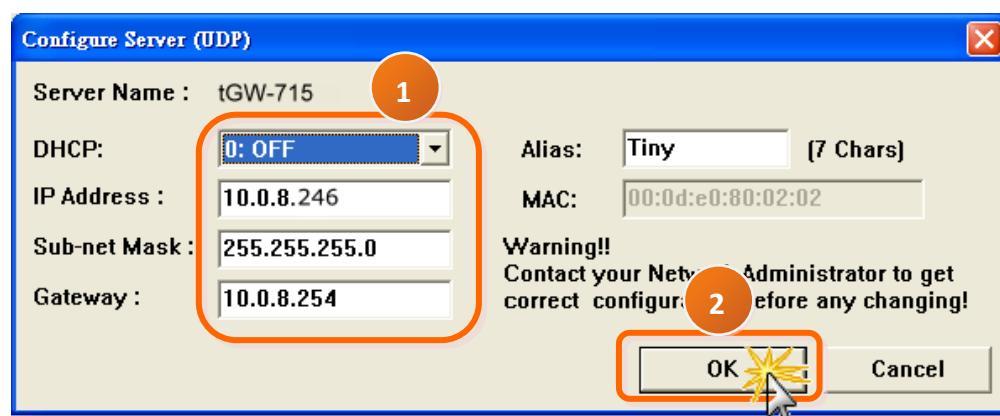

Figure 3-6

#### Step 4: Testing the tGW-700 series module

1. Connect the tGW-700 series module with Modbus device (e.g., M-7055D, optional) using the RS-485 bus. For more detailed information related to wiring options for RS-232/422/485, refer to [Section 2.7 Wiring Notes for RS-232/485/422 Interfaces](#).

##### ➤ RS-232 Wiring

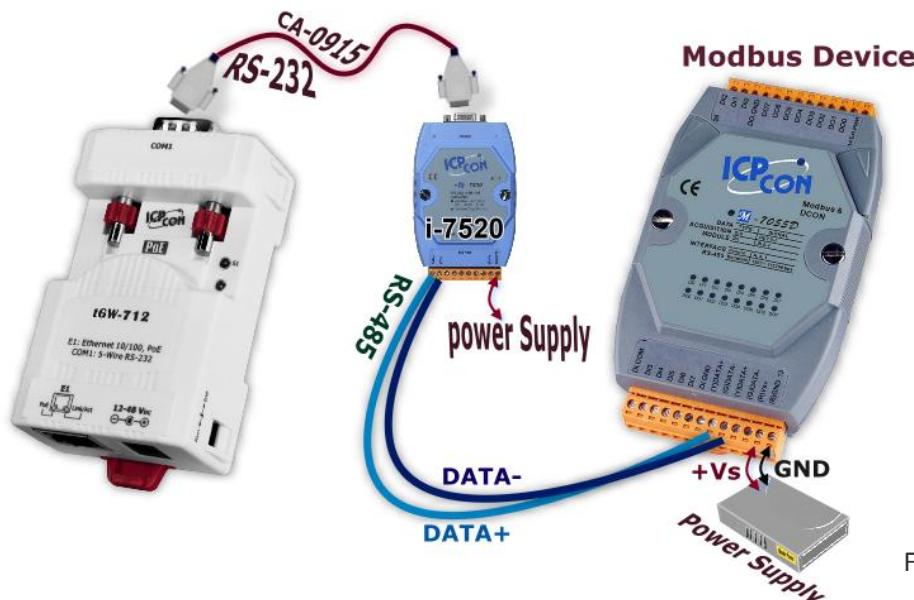

Figure 3-7

##### ➤ RS-485 Wiring

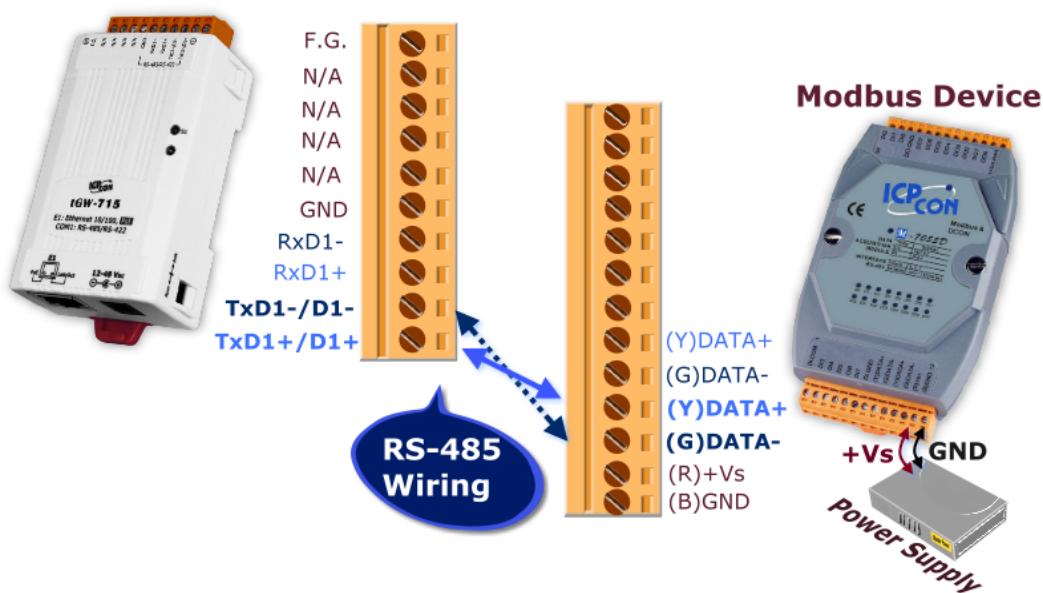

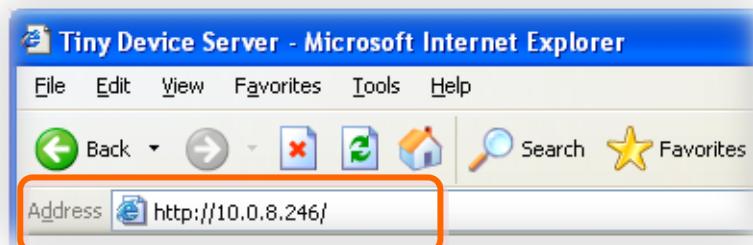

Figure 3-8

2. Open a web browser, such as Google Chrome, Internet Explorer, or Firefox, and enter the URL for the tGW-700 series module in the address bar of the browser, or click the “Web” button in the eSearch Utility.

3. When the login screen is displayed, enter the password (**use the default password: admin**) in the login password field, and then click the “Submit” button to enter the configuration web page.

#### The system is logged out.

To enter the web configuration, please type password in the following field.

Login password:	<input type="text" value="....."/>	<input type="button" value="Submit"/>
-----------------	------------------------------------	---------------------------------------

4. Click the “Port1” tab to display the Port1 Settings page.
5. Form the “Modbus Protocol” drop-down menu, select the protocol, either “Modbus RTU or Modbus ASCII” that is used by the attached Modbus devices. **Note: Only one protocol can be used for each serial port.**

**Tiny Modbus Gateway (tGW-71x)**

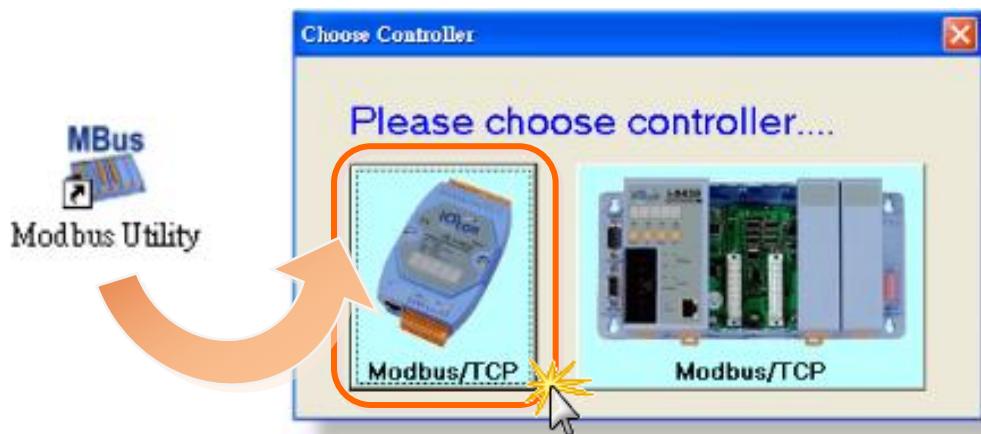

[Home](#) **Port1** [Network](#) | [Filter](#) | [Monitor](#) | [Password](#) | [Logout](#)

**Settings:**

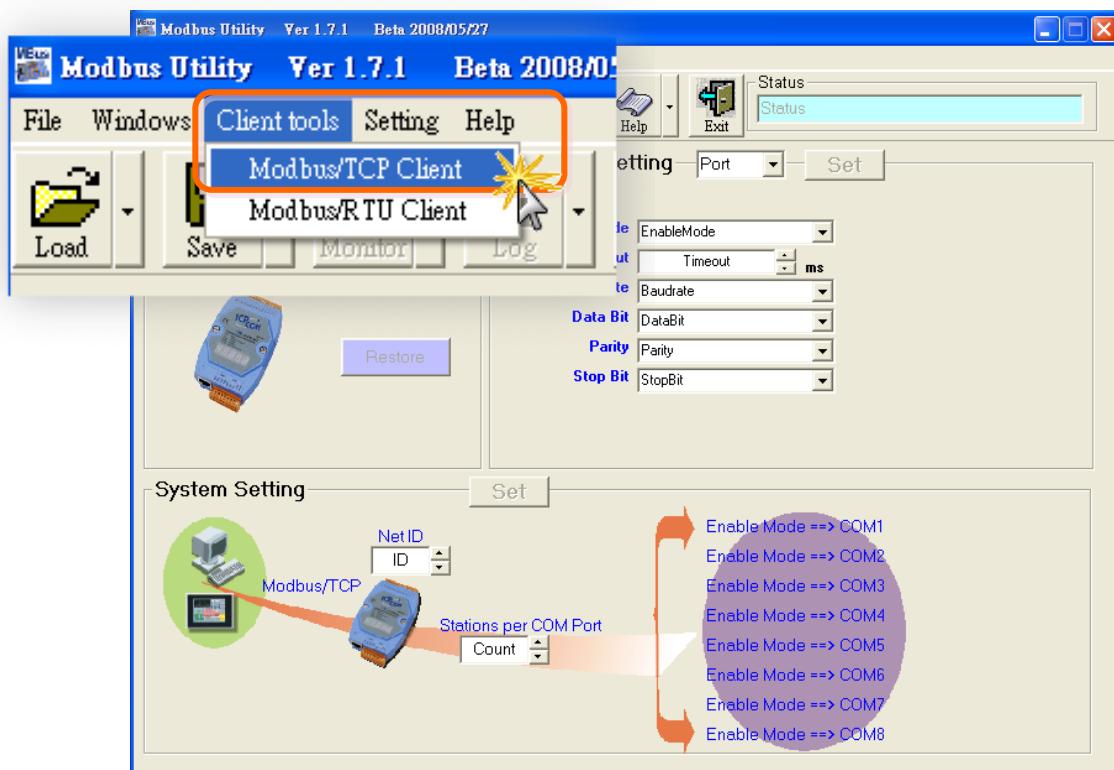

Port Settings	Current	Updated
Baud Rate (bps)	115200	115200 ▾ bits/S
Data Size (bits)	8	8 ▾ bits/character
Parity	None	None ▾
Stop Bits (bits)	1	1 ▾
Slave Timeout (ms)	300	300 ▾ (Default: 300)
Char Timeout (bytes)	4	4 ▾ (4 ~ 15, Default: 4)
Silent Time (ms)	0	0 ▾ (0, 10, 20... 65530, Default: 0)
Read Cache (ms)	980	980 ▾ (10, 20... 65530, Disable: 0)
Local TCP Port	502	502 ▾ (Default: 502)
TCP Timeout (seconds)	180	180 ▾ (1 ~ 65535, Default: 180, Disable: 0)
Modbus Protocol	Modbus RTU	Modbus RTU ▾

6. Open the Modbus Utility, and then click the “**Modbus/TCP**” button to select the controller.

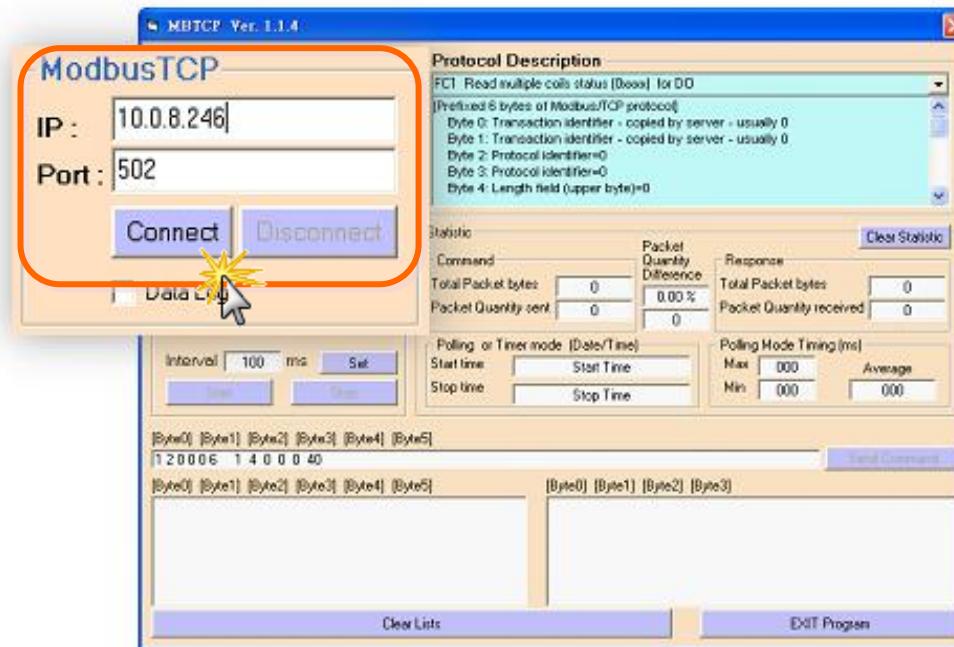

7. In the Modbus Utility, select the “**Modbus/TCP Client**” option from the “**Client tools**” menu.

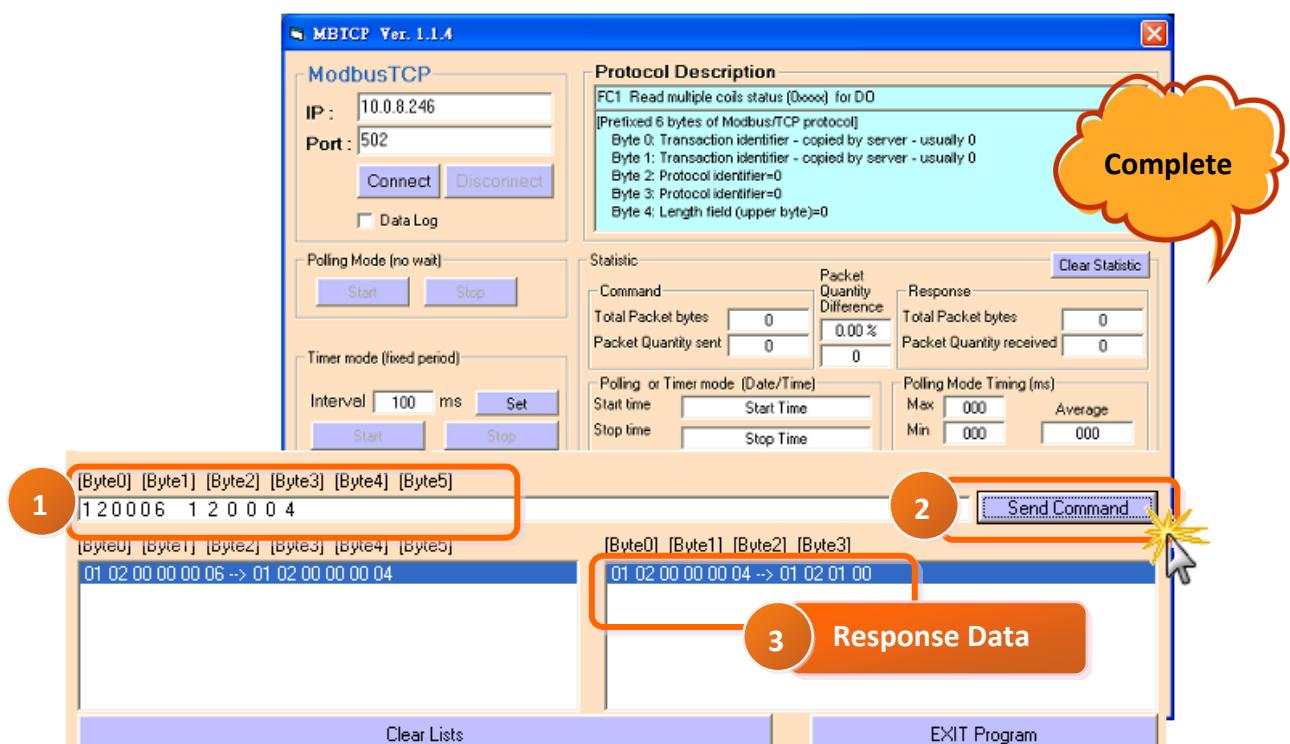

8. Enter the **IP address** and **TCP Port** information for the tGW-700 series module in the “Modbus TCP” section, and then click the “**Connect**” button to connect to the tGW-700.

9. Refer to the “**Protocol Description**” field in the top right-hand section of the Modbus Utility windows. You can send a request command and confirm that the response is correct. For example, if the Modbus device ID for the M-7000 is 1, send the command “1 2 0 0 0 6 1 2 0 0 0 4” to read the D/I value, the response will be “1 2 0 0 0 4 1 2 1 0”.

## 4. Web Configuration

Once the tGW-700 module has been correctly configured and is functioning normally on the network, the configuration details can be retrieved or modified using either the eSearch Utility described above, or via a standard web browser.

### 4.1 Logging in to the tGW-700 Web Server

The embedded tGW-700 series web server can be accessed from any computer that has an Internet connection.

**Step 1: Open a new browser window.**

Open a web browser, for example, Google Chrome, Firefox or Internet Explorer, which are reliable and popular Internet browsers that can be used to configure tGW-700 series module.

Note that if you intend to use Internet Explorer, ensure that the cache function is disabled in order to prevent browser access errors. Detailed instructions for how to do this can be found in [“FAQ: How to avoid a browser access error that causes a blank page to be displayed when using Internet Explorer”](#).

**Step 2: Enter the URL for the tGW-700 web server**

Ensure that you have correctly configured the network settings for the tGW-700 series module (refer to [Chapter 3 Setting up the tGW-700 module](#) for detailed instructions), and then enter the URL for the tGW-700 web server in the address bar of the browser.

### Step 3: Enter the Password

After the main login page is displayed, enter a password (the factory default password is “**admin**”), and then click the “**Submit**” button to continue.

The system is logged out.  
To enter the web configuration, please type password in the following field:

Login password

Note: This web configuration requires JavaScript enabled in your browser (Firefox, IE...). If the web configuration does not work, please check the JavaScript settings first.

When using IE, please disable its cache as follows.  
Menu items: Tools / Internet Options... / General / Temporary Internet Files / Settings... / Every visit to the page

### Step 4: Log in to the tGW-700 Web Server

After logging into the tGW-700 web server, the main page will be displayed.

**Tiny Modbus Gateway (tGW-71x)**

[Home](#) | [Port1](#) | [Network](#) | [Filter](#) | [Monitor](#) | [Password](#) | [Logout](#)

**Status & Configuration**

Model Name	tGW-715	Alias Name	Tiny
Firmware Version	v1.4.5 [Feb.20,2014]	MAC Address	00-0d-e0-80-0a-3f
IP Address	10.0.8.16	TCP Port Timeout (Socket Watchdog, Seconds)	180
Initial Switch	OFF	System Timeout (Network Watchdog, Seconds)	300

**Current port settings:**

Port Settings	Port 1
Baud Rate (bps)	115200
Data Size (bits)	8
Parity	None
Stop Bits (bits)	1
Modbus Protocol	RTU
Slave Timeout (ms)	300
Char Timeout (bytes)	4
Silent Time (ms)	0
Read Cache (ms)	980
Local TCP Port	502
TCP Timeout (Seconds)	180

Pair-Connection Settings (Master/Slave Mode)	Port 1
Server Mode	Server
Remote Server IP	-
Remote TCP Port	-
RTU Slave ID	-

## 4.2 Home Page

After clicking the **Home** tab, the main **Status & Configuration** page will be displayed, which is divided into two sections.

- The upper section of the page provides basic information related to the hardware and software for the tGW-700 series module, including the Firmware version and the IP Address, etc.

### Status & Configuration

Model Name	tGW-715	Alias Name	Tiny
Firmware Version	v1.4.5 [Feb.20,2014]	MAC Address	00-0d-e0-80-0a-3f
IP Address	10.0.8.16	TCP Port Timeout (Socket Watchdog, Seconds)	180
Initial Switch	OFF	System Timeout (Network Watchdog, Seconds)	300

- The lower section provides information related to the port settings and the pair-connection settings.

### Current port settings:

Port Settings	Port 1
Baud Rate (bps)	115200
Data Size (bits)	8
Parity	None
Stop Bits (bits)	1
Modbus Protocol	RTU
Slave Timeout (ms)	300
Char Timeout (bytes)	4
Silent Time (ms)	0
Read Cache (ms)	980
Local TCP Port	502
TCP Timeout (Seconds)	180
Pair-Connection Settings (Master/Slave Mode)	Port 1
Server Mode	Server
Remote Server IP	-
Remote TCP Port	-
RTU Slave ID	-

## 4.3 Network Page

### Tiny Modbus Gateway (tGW-71x)

[Home](#) | [Port1](#) | [Network](#) | [Filter](#) | [Monitor](#) | [Password](#) | [Logout](#)

After clicking the **Network** tab, the **Network and Miscellaneous Settings** page will be displayed, allowing you to verify the current settings, configure the IP Address, and the general parameters, and restore the default settings for the tGW-700 module, each of which will be described in more detail below.

### 4.3.1 Network and Miscellaneous Settings

The **Network and Miscellaneous Settings** page provides basic details of the tGW-700 module and other information related to the hardware and software.

#### Network and Miscellaneous Settings

Model Name	tGW-718	Alias Name	Tammy
Firmware Version	v1.4.6 [Aug.05,2014]	MAC Address	00-0d-e0-80-00-6b
IP Address	10.0.8.5	TCP Port Timeout (Socket Watchdog, Seconds)	180
Initial Switch	OFF	System Timeout (Network Watchdog, Seconds)	300

The software and hardware information section includes information related to the Model Name, the current Firmware version, the IP Address, the current position of the Initial Switch, the Alias, the MAC Address, and the TCP Port, and the System Timeout values. **If you update the firmware for the tGW-700 module, this page can be used to check the version information of the tGW-700 software.**

## 4.3.2 IP Address Selection

The **Address Type**, **Static IP Address**, **Subnet Mask** and **Default Gateway** values are the most important network settings and should always correspond to the LAN configuration. If they do not match, the tGW-700 module will not operate correctly. If the settings are changed while the module is operating, any connection currently in use will be lost and an error will occur.

### IP Address Selection

Address Type	DHCP
Static IP Address	0 . 0 . 0 . 0
Subnet Mask	0 . 0 . 0 . 0
Default Gateway	0 . 0 . 0 . 0
MAC Address	00-0d-e0-80-00-6b (Format: FF-FF-FF-FF-FF-FF)
Gateway Net ID	255 (Default: 255) Note: This is reserved for gateway, NOT for slave devices.
Update Settings	

The following is an overview of the parameters contained in the IP Address configuration section:

Item	Description
<b>Address Type</b>	<b>Static IP:</b> If no DHCP server is installed on the network, the network settings can be configured manually. Refer to <a href="#">Section 4.3.2.1 Manual Configuration</a> for more details.
	<b>DHCP:</b> The Dynamic Host Configuration Protocol (DHCP) is a network application protocol that automatically assigns an IP address to each device. Refer to <a href="#">Section 4.3.2.2 Dynamic Configuration</a> for more details.
<b>Static IP Address</b>	Each tGW-700 connected to the network must have its own unique IP address. This parameter is used to assign a specific IP address.
<b>Subnet Mask</b>	This parameter is used to assign the subnet mask for the tGW-700. The subnet mask indicates which portion of the IP address is used to identify the local network or subnet.
<b>Default Gateway</b>	This parameter is used to assign the IP Address of the Gateway to be used by the tGW-700. A Gateway (or router) is a device that is used to connect an individual network to one or more additional networks.
<b>MAC Address</b>	This parameter is used to set a user-defined MAC address, which must be in the format FF-FF-FF-FF-FF-FF.
<b>Modbus Net ID (for Gateway)</b>	This parameter is used to set the device ID to be used by the tGW-700. The default value is 255.
<b>Update Settings</b>	Click this button to save the revised settings to the tGW-700.

### 4.3.2.1 Manual Configuration

When using manual configuration, the network settings should be assigned in the following manner:

**Step 1:** Select the “**Static IP**” option from the “**Address Type**” drop-down menu.

**Step 2:** Enter the relevant details in the respective **network settings** fields.

**Step 3:** Click the “**Update Settings**” button to complete the configuration.

Address Type	Static IP	1
Static IP Address	10 . 0 . 8 . 12	2
Subnet Mask	255 . 255 . 255 . 0	
Default Gateway	10 . 0 . 8 . 254	
MAC Address	00-0d-e0-80-00-6b	(Format: FF-FF-FF-FF-FF-FF)
Gateway Net ID	255	(Default: 255) Note: This is reserved for gateway, NOT for slave devices.
<input type="button" value="Update Settings"/> 3		

### 4.3.2.2 Dynamic Configuration

Dynamic configuration is very easy to perform. If a DHCP server is connected to your network, a network address can be dynamically configured by using the following procedure:

**Step 1:** Select the “**DHCP**” option from the “**Address Type**” drop-down menu.

**Step 2:** Click the “**Update Settings**” button to complete the configuration.

Address Type	DHCP	1
Static IP Address	0 . 0 . 0 . 0	
Subnet Mask	0 . 0 . 0 . 0	
Default Gateway	0 . 0 . 0 . 0	
MAC Address	00-0d-e0-80-00-6b	(Format: FF-FF-FF-FF-FF-FF)
Gateway Net ID	255	(Default: 255) Note: This is reserved for gateway, NOT for slave devices.
<input type="button" value="Update Settings"/> 2		

### 4.3.3 General Settings

#### General Settings

Ethernet Speed	<input type="button" value="Auto"/> (Auto=10/100 Mbps Auto-negotiation)
Alias Name	Tammy (Max. 18 chars)
System Timeout (Network Watchdog)	300 (30 ~ 65535 seconds, Default: 300, Disable: 0)
Web Auto-logout	10 (1 ~ 65535 minutes, Default: 10, Disable: 0)
UDP Configuration	<input type="button" value="Enable"/> (Enable/Disable the UDP Configuration, Enable=default.)
Protocol Exception	1 (Default: 1, Disable: 0, Enable: 1) Reports exception 0x41 when slave response is invalid Modbus message.
CRC Exception	1 (Default: 1) 0: Gateway returns raw data including CRC when CRC error. 1: Gateway reports exception 0x43 when CRC error. 2: Gateway drops packet when CRC error.
Timeout Exception	1 (Default: 1, Disable: 0, Enable: 1) Gateway reports exception 0x0B for slave no response, and 0x4B for data timeout.
Busy Exception	1 (Default: 1, Disable: 0, Enable: 1) Gateway reports exception 0x06 when queued requests are full.
Check TCP Header	1 (Default: 1, Disable: 0, Enable: 1) Drops packet when Modbus TCP header (protocol ID, length) is wrong.
<input type="button" value="Update Settings"/>	

The following is an overview of the parameters contained in the General Settings section:

Item	Description	Default
Ethernet Speed	This parameter is used to set the Ethernet speed. The default value is Auto (Auto = 10/100 Mbps Auto-negotiation).	Auto
Alias Name	This parameter is used to assign an alias for each tGW-700 device to assist with easy identification.	Tiny
System Timeout (Network Watchdog)	This parameter is used to configure the system timeout value. If there is no activity on the network for a specific period of time, the system will be rebooted based on the configured system timeout value.  Timeout value range: 30 to 65535 (seconds); Disable = 0;	0
Web Auto-logout	This parameter is used to configure the automatic logout value. If there is no activity on the web server for a certain period of time, the current user account will be automatically logged out.  Range: 1 to 65535 (minutes); Disable = 0.	10

<b>UDP Configuration</b>	This parameter is used to enable or disable UDP configuration function.	1
<b>Protocol Exception</b>	This parameter is used to enable or disable whether the slave response is checked for compatibility with the Modbus RTU format. If the slave response is an invalid Modbus message, a 0x41 exception code will be reported.  Enable =1; Disable = 0.	1
<b>CRC Exception</b>	This parameter is used to enable or disable whether the validity of the RTU/ASCII CRC of the slave response is checked.  0 = Returns the raw data, including the CRC, if a CRC error occurs; 1 = Reports a 0x43 exception code if a CRC error occurs; 2 = Drops the packet if a CRC error occurs.	1
<b>Timeout Exception</b>	This parameter is used to enable or disable whether a slave/data timeout exception error is reported by the Gateway. If There is no response from a slave device, a 0x0B exception error will be reported. If serial data is being received, a 0x4B exception will be reported.  Enable =1; Disable = 0.	1
<b>Busy Exception</b>	This parameter is used to enable or disable whether a busy exception code (0x06) is reported if the Gateway request queue is full.  Enable =1; Disable = 0.	1
<b>Check TCP Header</b>	This parameter is used to enable or disable the drop-packet function when the Modbus TCP header is invalid.  Enable = 1; Disable = 0.	1
<b>Update Settings</b>	Click this button to save the revised settings to the tGW-700 device.	

## 4.3.4 Restore Factory Defaults

### Restore Factory Defaults

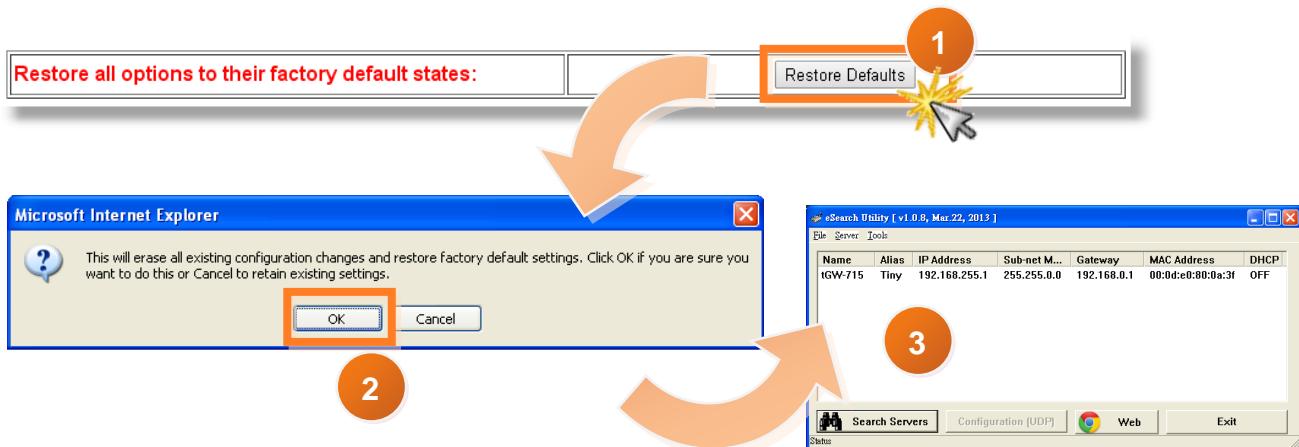

<b>Restore all options to their factory default states:</b>	<input type="button" value="Restore Defaults"/>
<b>Forced Reboot</b>	<input type="button" value="Reboot"/>

➤ Use the following procedure to reset all parameters to their original factory default settings:

**Step 1:** Click the “Restore Defaults” button to reset the configuration.

**Step 2:** Click the “OK” button in the message dialog box.

**Step 3:** Check whether the module has been reset to the original factory default settings for use with the eSearch Utility. Refer to [Chapter 3 Setting up the tGW-700 Module](#) for more details.

The following is an overview of the factory default settings:

<b>Factory Default Settings</b>	
<b>Network Settings</b>	
IP Address	192.168.255.1
Gateway Address	192.168.0.1
Subnet Mask	255.255.0.0
DHCP	Disabled
<b>Basic Settings</b>	
Alias	Tiny

- The **Forced Reboot** function: can be used to force the tGW-700 to reboot or to remotely reboot the device. After the tGW-700 module has rebooted, the original login screen will be displayed requesting that you enter your Login Password before continuing.

The screenshot shows a web browser window for the 'Tiny Modbus Gateway (tGW-71x)'. At the top left, there is a red button labeled 'Forced Reboot'. To its right is a white button labeled 'Reboot' with a small orange outline. A large orange arrow points downwards from the 'Reboot' button towards the main content area of the page. In the main content area, the ICP DAS logo is visible on the left. The title 'Tiny Modbus Gateway (tGW-71x)' is centered above a menu bar with links: Home | Port1 | Network | Filter | Monitor | Password | Logout. Below the menu, a message states 'The system is logged out.' followed by a note: 'To enter the web configuration, please type password in the following field.' A 'Login password' input field is shown with a 'Submit' button next to it. A red note at the bottom left of the content area says: 'Note: This web configuration requires JavaScript enabled in your browser (Firefox, IE...). If the web configuration does not work, please check the JavaScript settings first.' Another note below it says: 'When using IE, please disable its cache as follows. Menu items: Tools / Internet Options... / General / Temporary Internet Files / Settings... /'.

## 4.3.5 Update by Ethernet

### Update by Ethernet

You may need to return the module for repair if the firmware update is failed!

Update

The Firmware update function is only supported by the **firmware version is v1.4.6 [Aug.05, 2014] or later** and it can update firmware without any manual operation in the Init/Run Switch and reboot.

For detailed information about how to update the Firmware in run mode for your tGW-700 series module, refer to the **tGW\_Firmware\_v146\_and\_later\_Update\_vxxx\_en.pdf**.

The location of the user manual on the CD and the download address are shown below:

CD:\NAPDOS\tGW-700\Firmware\

<http://ftp.icpdas.com/pub/cd/tinymodules/napdos/tgw-700/firmware/>

## 4.4 Serial Port Page

### Tiny Modbus Gateway (tGW-71x)

[Home](#) | **Port1** | [Network](#) | [Filter](#) | [Monitor](#) | [Password](#) | [Logout](#)

After clicking the **Port1** tab, the serial port settings page will be displayed, allowing you to configure the settings for the tGW-700, including the Baud Rate, Data Format, Slave Timeout, Char Timeout, Silent Time, Read Cache, TCP Timeout, Modbus Protocol and Pair-connection parameters, etc., each of which will be described in more detail below.

### 4.4.1 Port 1 Settings

The Port 1 Settings section provides basic information related to the hardware and software for the tGW-700 series module, including the Firmware version and the IP Address, etc.

#### Port 1 Settings

Model Name	tGW-718	Alias Name	Tammy
Firmware Version	v1.4.6 [Aug.05,2014]	MAC Address	00-0d-e0-80-00-6b
IP Address	10.0.8.5	TCP Port Timeout (Socket Watchdog, Seconds)	180
Initial Switch	OFF	System Timeout (Network Watchdog, Seconds)	300

#### Settings:

Port Settings	Current	Updated
Baud Rate (bps)	115200	115200 ▾ bits/S
Data Size (bits)	8	8 ▾ bits/character
Parity	None	None ▾
Stop Bits (bits)	1	1 ▾
Slave Timeout (ms)	300	300 ▾ (Default: 300)
Char Timeout (bytes)	4	4 ▾ (4 ~ 15, Default: 4)
Silent Time (ms)	0	0 ▾ (0, 10, 20... 65530, Default: 0)
Read Cache (ms)	980	980 ▾ (10, 20... 65530, Disable: 0)
Local TCP Port	502	502 ▾ (Default: 502)
TCP Timeout (seconds)	180	180 ▾ (1 ~ 65535, Default: 180, Disable: 0)
Modbus Protocol	Modbus RTU	Modbus RTU ▾
Pair-Connection Settings (Master/Slave Mode)	Current	Updated
Server Mode	Server	Server ▾ (Server=Slave, Client=Master)
Modbus Protocol	TCP	TCP ▾
Remote Server IP	Disabled	10 . 0 . 8 . 244 ▾
Remote TCP Port	Disabled	502 ▾
RTU Virtual ID (1~247)	0	0 ▾ (0: Bypass, No check)
TCP Slave ID (1~247)	0	0 ▾ (0: Same as RTU)

## 4.4.2 Settings (Port Settings)

The Settings (Port Settings) section allows configuration of parameters such as the Baud Rate, Data Format, Slave Timeout, Char Timeout, Silent Time, Read Cache Time, TCP Timeout, and Modbus Protocol, etc. A more detailed description of these parameters together with the default values is provided below.

### Settings:

Port Settings	Current	Updated
Baud Rate (bps)	115200	115200 ▾ bits/S
Data Size (bits)	8	8 ▾ bits/character
Parity	None	None ▾
Stop Bits (bits)	1	1 ▾
Slave Timeout (ms)	300	300 (Default: 300)
Char Timeout (bytes)	4	4 (4 ~ 15, Default: 4)
Silent Time (ms)	0	0 (0, 10, 20... 65530, Default: 0)
Read Cache (ms)	980	980 (10, 20.. 65530, Disable: 0)
Local TCP Port	502	502 (Default: 502)
TCP Timeout (seconds)	180	180 (1 ~ 65535, Default: 180, Disable: 0)
Modbus Protocol	Modbus RTU	Modbus RTU ▾

The following is an overview of the parameters contained in the Settings – Port Settings section:

Item	Description	Default
<b>Port Settings</b>		
<b>Baud Rate (bps)</b>	This parameter is used to set the Baud Rate for the COM ports.	115200
<b>Data Size (bits)</b>	This parameter is used to set the Data Size for the COM ports.	8
<b>Parity</b>	This parameter is used to set the Parity for the COM ports.	None
<b>Stop Bits (bits)</b>	This parameter is used to set the Stop Bits for the COM ports.	1
<b>Slave Timeout (ms)</b>	<p>This parameter is used to set the waiting time that should elapse after last character of the request sent to the device before the timeout is activated. The tGW-700 will report a 0x0B exception code if there is no response from the slave device before the timeout period expires, or will report a 0x4B exception code if the slave device is still sending data when the timeout is activated.</p> <p>The Slave Timeout value must be set to less than the response timeout configured in the client software.</p>	300

<b>Char Timeout (bytes)</b>	This parameter is used to set the waiting time (based on bytes) that should elapse after last byte of data of the response is received from the slave device is activated. If no more data is received before the timeout period expires, then the transmission of this packet is deemed to have been completed and the tGW-700 begins processing the packet.  Valid range: 4 to 15 (bytes);	4
<b>Silent Time (ms)</b>	This parameter is used to set the idle time that should elapse before sending each request to the serial port. This causes the serial bus to be "silent" for the specified period, and allows slower slave devices more time to process previous requests and responses, thereby reducing communication problems.  Valid range: 10, 20 to 65530 (ms);	0
<b>Read Cache (ms)</b>	When sharing Modbus RTU/ASCII device/data between several master devices, the read-cache function can be used to reduce the loading on the serial communication and ensure faster TCP responses.  Valid range: 10, 20 to 65530 (ms); Disable = 0.	980
<b>Local TCP Port</b>	This parameter is used to configure the Modbus TCP port.  Note: The default COM1/COM2/COM3 = TCP Ports 502/503/504.	502
<b>TCP Timeout (seconds)</b>	If Modbus TCP communication is idle for a specified period of time, the system will automatically terminate the connection.  Valid range: 1 to 65535 (seconds); Disable = 0;	180
<b>Modbus Protocol</b>	This parameter is used to configure the serial port that is used by the Modbus RTU or Modbus ASCII protocol.	Modbus RTU

## 4.4.3 Settings (Pair-Connection Settings)

Pair-Connection Settings (Master/Slave Mode)		Current	Updated
Server Mode	Server	<input type="button" value="Server ▾ (Server=Slave, Client=Master)"/>	
Modbus Protocol	TCP	<input type="button" value="TCP ▾"/>	
Remote Server IP	Disabled	<input type="text" value="10"/> . <input type="text" value="0"/> . <input type="text" value="8"/> . <input type="text" value="244"/>	
Remote TCP Port	Disabled	<input type="text" value="502"/>	
RTU Virtual ID (1~247)	0	<input type="text" value="0"/> (0: Bypass, No check)	
TCP Slave ID (1~247)	0	<input type="text" value="0"/> (0: Same as RTU)	
<input type="button" value="Submit"/>			

The following is an overview of the parameters contained in the Settings – Pair-Connection Settings (Master/Slave Mode) section:

Pair-Connection Settings (Master/Slave Mode)		
<b>Server Mode</b>	Server	Client
<b>Modbus Protocol</b>	-	Select the Modbus protocol (Modbus TCP or UDP) for the remote device
<b>Remote Server IP</b>	Disabled	The IP address for the remote device
<b>Remote TCP Port</b>	Disabled	The TCP Port number for the remote device
<b>RTU Slave ID (1~247)</b>	Disabled	The Modbus RTU Slave ID of the tGW-700
<b>TCP Slave ID (1~247)</b>	Disabled	The Modbus TCP Slave ID of the remote device
<b>Update Settings</b>	Click this button to save the revised settings to the tGW-700.	

Notes:

1. For more detailed information regarding pair-connection applications settings, refer to [Section 5.3 Pair-Connection Applications](#).
2. For more detailed information regarding the mapping configuration for the Modbus RTU Slave ID and the TCP Slave ID, refer to [“FAQ: How to access multiple Modbus TCP slave devices from a single Modbus RTU/ASCII master device.”](#)

## 4.5 Filter Page

### Tiny Modbus Gateway (tGW-71x)

[Home](#) | [Port1](#) | [Network](#) | [Filter](#) | [Monitor](#) | [Password](#) | [Logout](#)

After clicking the **Filter** tab, the **Accessible Settings** page will be displayed allowing you configure the IP Filter list for the tGW-700 device, which will be described in more detail below.

### 4.5.1 Accessible IP (filter is disabled when all zero)

The Accessible IP Settings page is used to query or edit the IP Filter List. The IP Filter List restricts the access of packets based on the IP header. If one or more IP address are saved to the IP Filter table, only clients whose IP is specified in the IP Filter List can access the tGW-700.

#### Accessible IP (filter is disabled when all zero):

IP Filter List		IP Address
		IP0: 0.0.0.0
		IP1: 0.0.0.0
		IP2: 0.0.0.0
		IP3: 0.0.0.0
		IP4: 0.0.0.0

Add  .  .  .  To The List  
 Delete IP#  (Number: 0 ~ 4)  
 Delete ALL  
 Save Configuration (finish)

The following is an overview of the parameters contained in the Accessible IP section:

Item	Description
Add “IP” to the list	Add an IP address to the IP Filter List.
Delete IP# “Number”	Delete a specific IP# address from the IP Filter List. (Number = 0 to 4)
Delete All	Delete all items from the IP Filter List.
Save Configuration (finish)	Save a new IP Filter List to the Flash memory.
Submit	Click this button to save the revised settings to the tGW-700.

## 4.6 Monitor Page

After clicking the **Monitor** tab, the Current Connection Status page will be displayed showing detailed information regarding the current status of the serial port connection settings for the tGW-700 module.

**Tiny Modbus Gateway (tGW-71x)**

[Home](#) | [Port1](#) | [Network](#) | [Filter](#) | **Monitor** | [Password](#) | [Logout](#)

**Current Connection Status:**

Port Number	Port 1
Server Mode	Server
Connected IP1:	0.0.0.0
IP2:	0.0.0.0
IP3:	0.0.0.0
IP4:	0.0.0.0
Available Connections:	32
Queued MB Requests:	0
Busy Error:	-
Last Error:	0,0,0

[Clear Last Error](#)

Note:

1. [CLICK HERE](#) for error codes and descriptions.
2. The "Busy Error" can happen when too many Modbus requests are queued and waiting for process. Set a larger timeout and scan-time value on all master software (clients) for fixing this problem.

Copyright © 2010 ICP DAS Co., Ltd. All rights reserved.

## 4.7 Password Page

After clicking the **Password** tab, the **Change Password** page will be displayed. To change a password, first enter the old password in the “**Current password**” field (use the default password “**admin**”) and then enter a new password in the “**New password**” field. Re-enter the new password in the “**Confirm new password**” field, and then click the “**Submit**” button to update the password.

**Tiny Modbus Gateway (tGW-71x)**

[Home](#) | [Port1](#) | [Network](#) | [Filter](#) | [Monitor](#) | **Password** | [Logout](#)

**Change Password**  
The length of the password is 12 characters maximum.

Current password	.....
New password	.....
Confirm new password	.....

**Submit**

## 5. Typical Applications

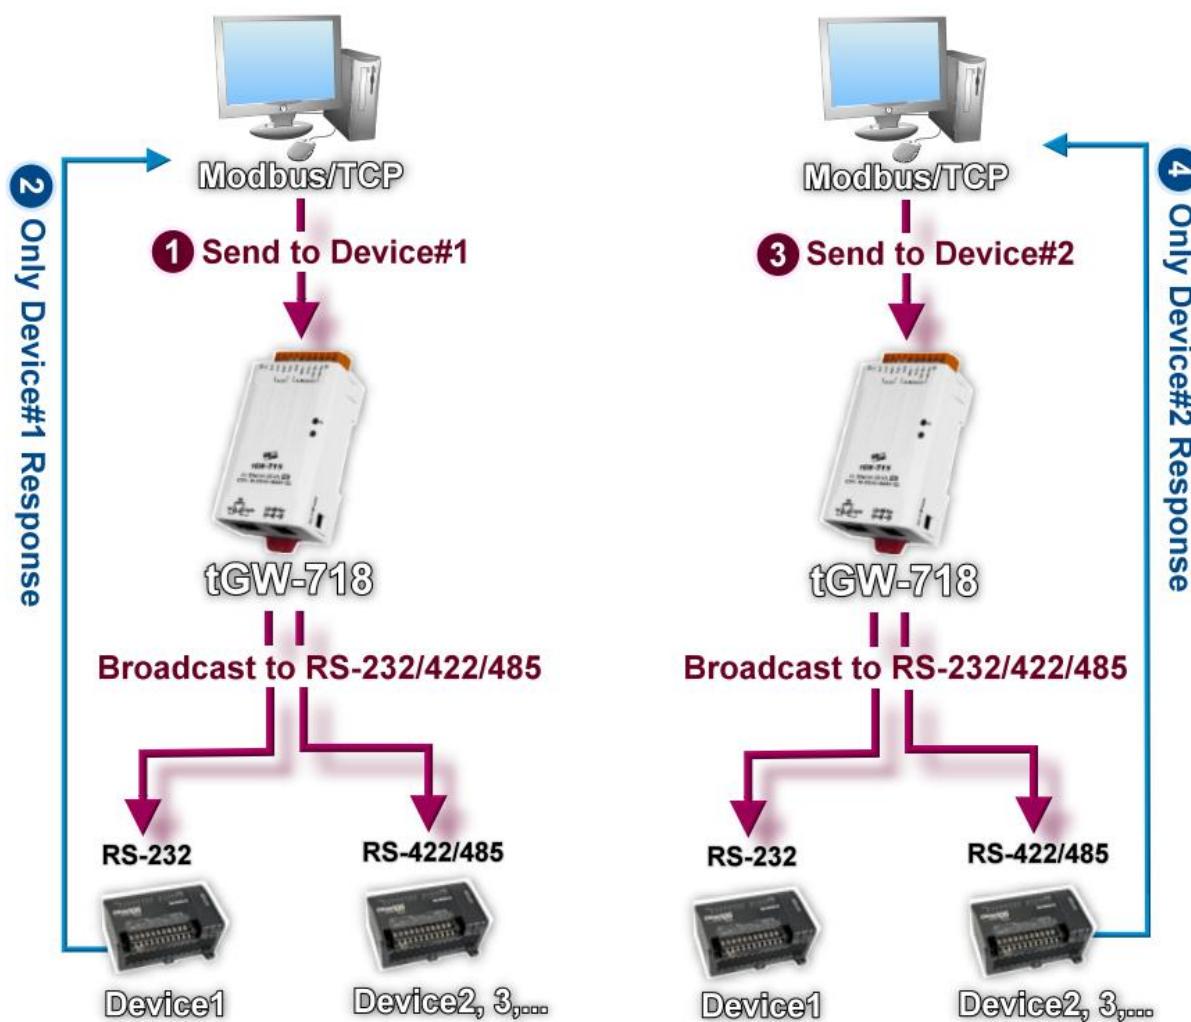

This chapter provides some examples of typical scenarios for the tGW-700 module, including applications focused on the Modbus Gateway, Modbus Net ID, Pair-connection and TCP Client Mode, etc..

## 5.1 Modbus Gateway

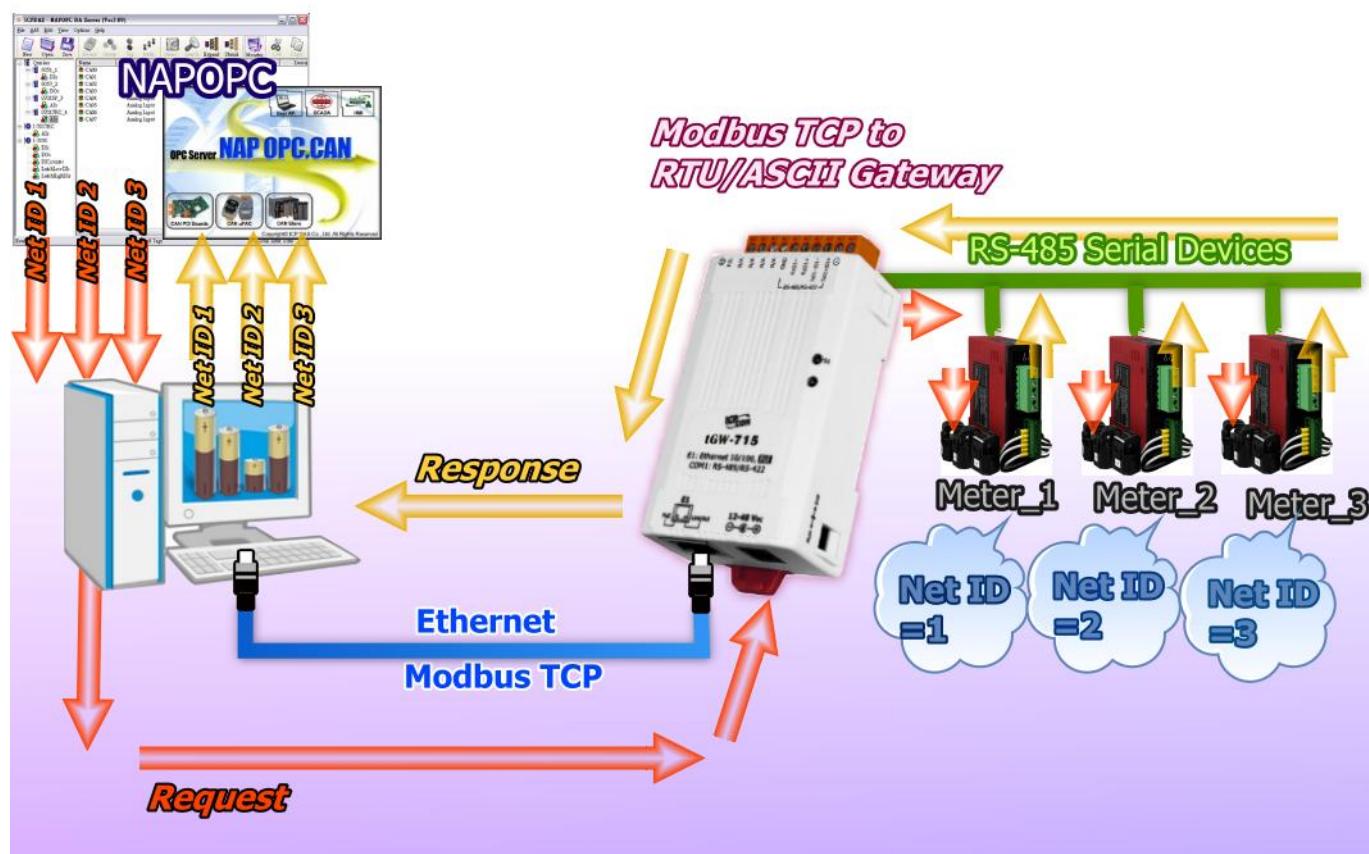

The tGW-700 module is a Modbus TCP/UDP to RTU/ASCII gateway that enables a Modbus TCP/UDP host to communicate with serial Modbus RTU/ASCII devices through an Ethernet network, and eliminates the inherent cable length limitations of legacy serial communication devices.

## 5.2 Modbus Net ID

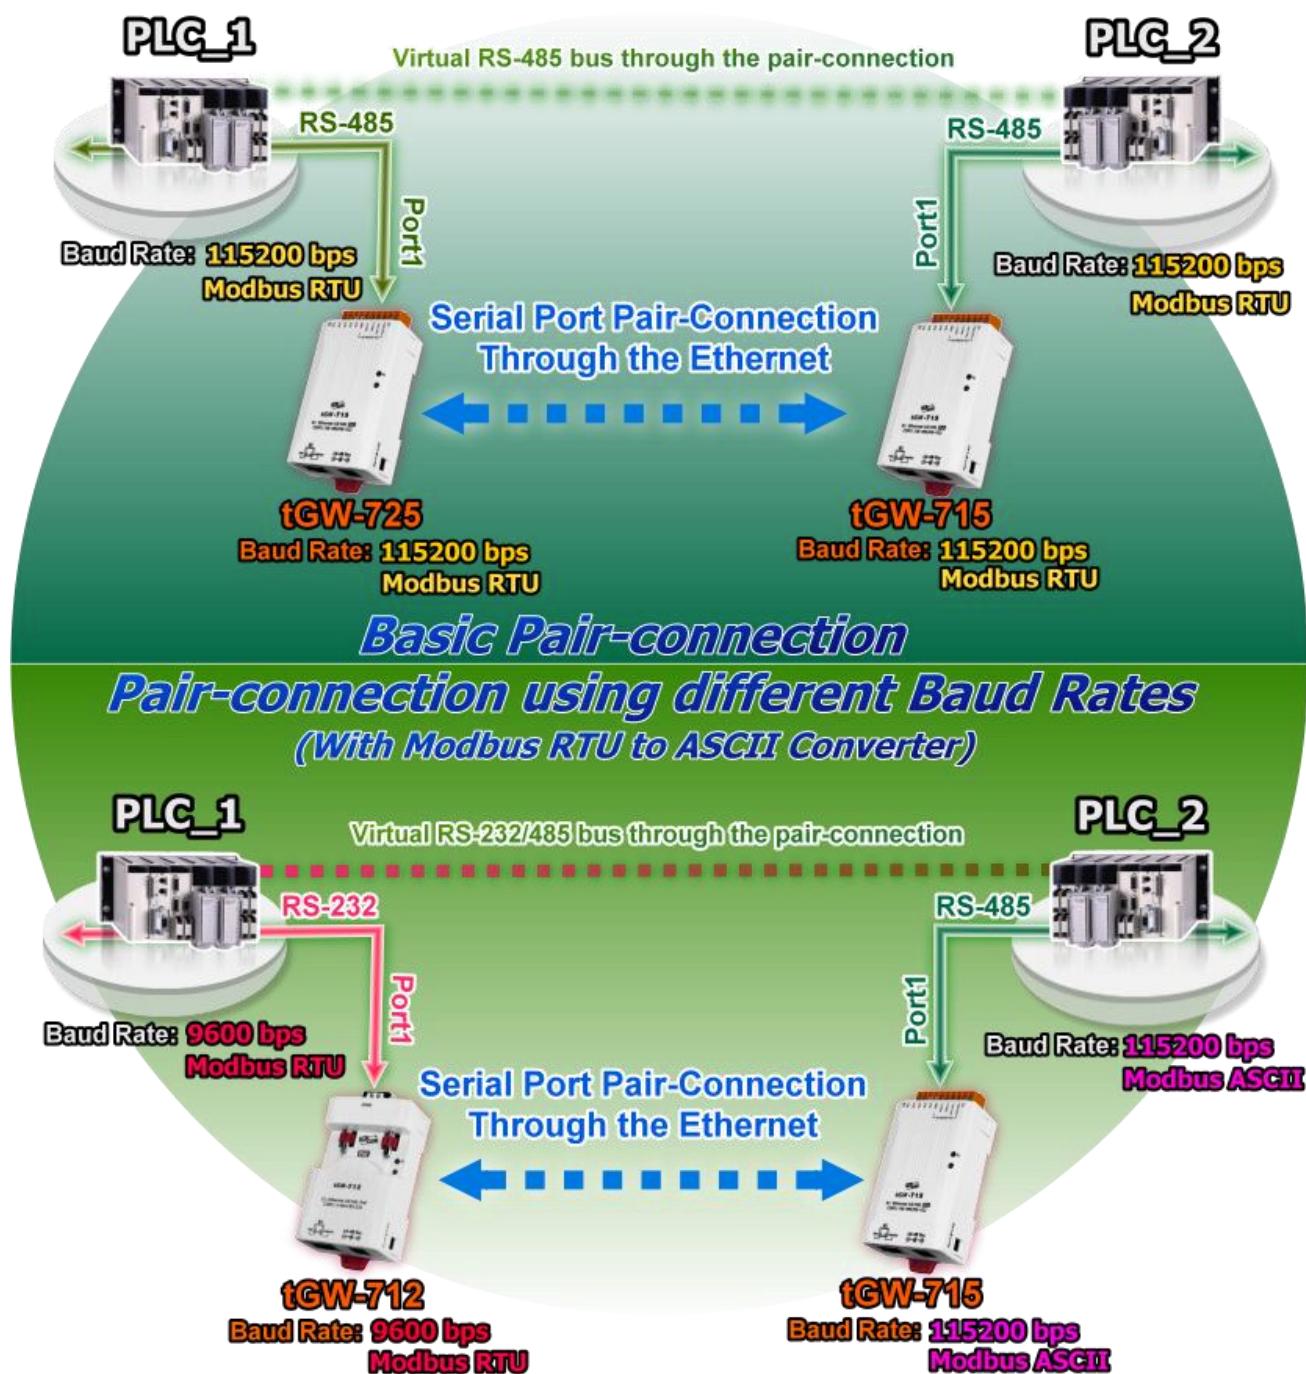

The tGW-700 series module is a gateway that can be used to convert between the Modbus TCP/UDP protocol and the Modbus RTU/ASCII protocol. Consequently, SCADA/HMI applications is able to access each Modbus RTU/ASCII slave device via the tGW-700 gateway by specifying correct NetID of the intended slave device in each Modbus TCP request. **Note that the NetID of the tGW-700 gateway is reserved for specific control purposes, and is not used to access slave devices.**

## 5.3 Pair-connection Applications

The tGW-700 Modbus gateway can be used to create a pair-connection applications (as well as serial-bridge or serial-tunnel), and then route Modbus messages between two serial devices via TCP/IP, which is useful when connecting Modbus RTU/ASCII devices that do not themselves have Ethernet capability.

## The following are examples of pair-connection tests:

### Pair-connection Settings:

Model	Port Settings (default)		Pair-connection Settings		
	Baud Rate	Data Format	Server Mode	Remote Server IP	Remote TCP Port (default)
tGW-700 #1	115200	8N1	Client	IP Address of tGW-700 #2	502
tGW-700 #2	115200	8N1	Server	-	-

#### Note:

The Baud Rate and Data Format settings of the client and server (tGW-700 #1 and #2) depend on the COM ports of the PC (or the connected device). The serial port settings between tGW-700 #1 and tGW-700#2 can be different.

Follow the procedure described below:

#### Step 1: Connecting to a network, PC and Power

1. Confirm that the tGW-700 modules are functioning correctly. For detailed information regarding how to install, configure and operate your tGW-700 series module, refer to [Chapter 3 Setting up the tGW-700 Module](#).

2. Use an I-7520 module to connect COM1 on the PC to COM1 on tGW-700 #1. For detailed information regarding RS-422/485 wiring, refer to [Section 2.7 Wiring Notes](#).  
(For detailed information related to the I-7520 module, refer to:  
[http://www.icpdas.com/products/Remote\\_IO/i-7000/i-7520.htm](http://www.icpdas.com/products/Remote_IO/i-7000/i-7520.htm))

3. Connect the Modbus device (e.g., M-7055D) to COM1 of tGW-700 #2.

(For detailed information related to the M-7055D module, refer to:

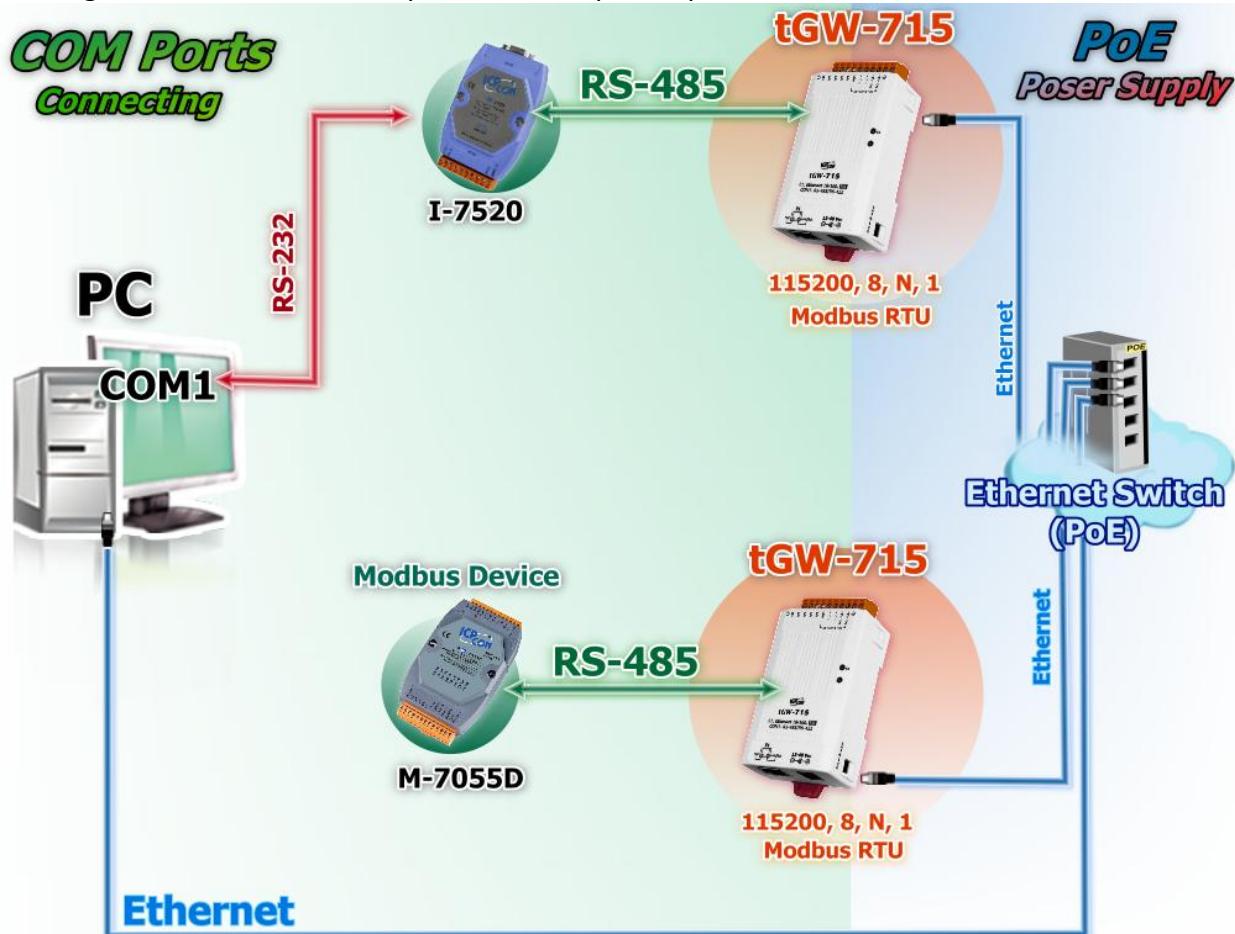

[http://www.icpdas.com/products/Remote\\_IO/m-7000/m-7055d.htm](http://www.icpdas.com/products/Remote_IO/m-7000/m-7055d.htm))

※ Refer to [Figure 5-1](#) for an illustration of how to perform Steps 1-1 to 1-3 of the procedure described above.

The image below shows an example of the setup for a pair-connection test:

Figure 5-1

### Step 2: Configuring the Ethernet Settings

Contact your Network Administrator to obtain the correct and functioning network configuration for the tGW-700 modules (including the **IP Address**, **Mask** and **Gateway** details). Also refer to [Chapter 3 Setting up the tGW-700 Module](#) for more details.

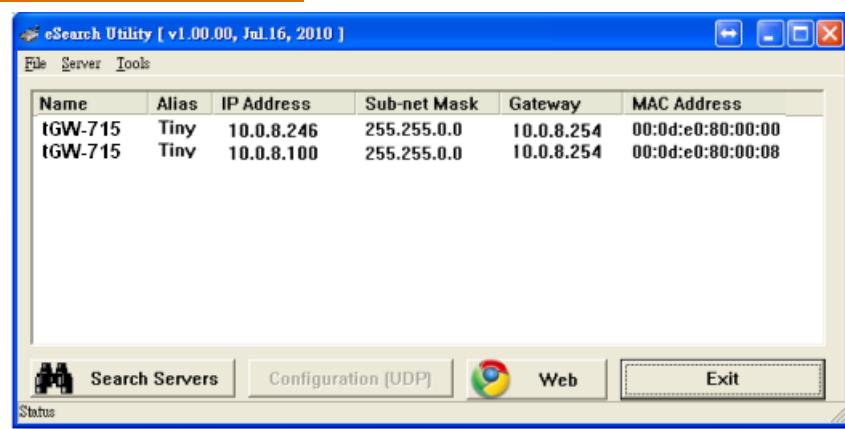

Figure 5-2

### Step 3: Configuring the Pair-connection (Client Mode) on the Web Server for tGW-700 #1

1. Open the eSearch Utility to search for the tGW-700 modules connected to the network. Click the name of the first tGW-715 module (tGW-700 #1) to select it, and then click the “Web” button to launch a browser window to connect to the web server on the tGW-700 #1 module. Alternatively, you can enter the URL for tGW-700 #1 in the address bar of the browser.
2. When the login screen is displayed, enter the password (use the default password “admin”) in the Password field, and then click the “Submit” button to display the configuration page.

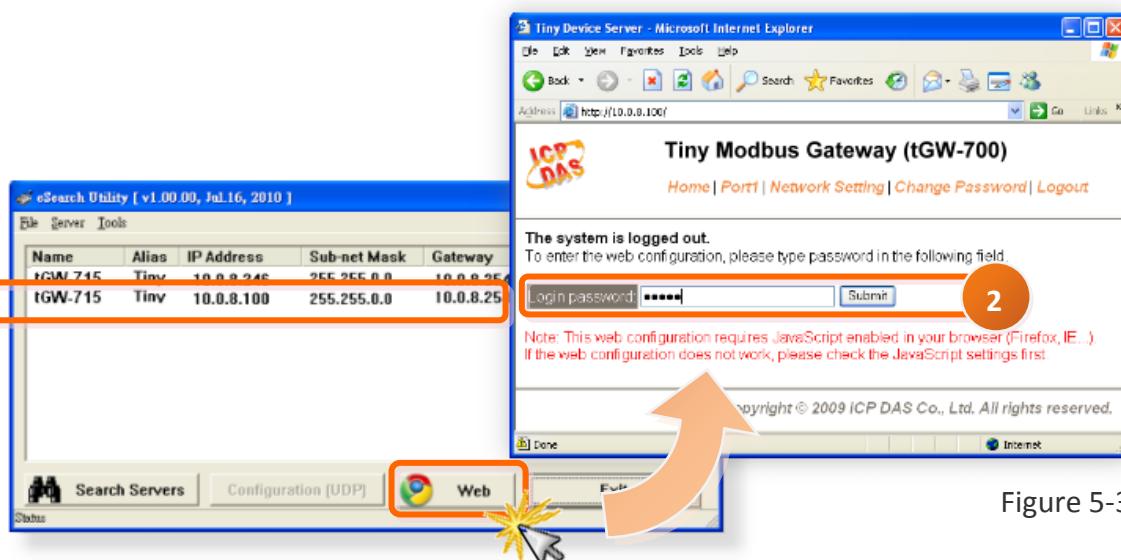

Figure 5-3

3. Click the “Port1” tab to display to the Port1 Settings page.

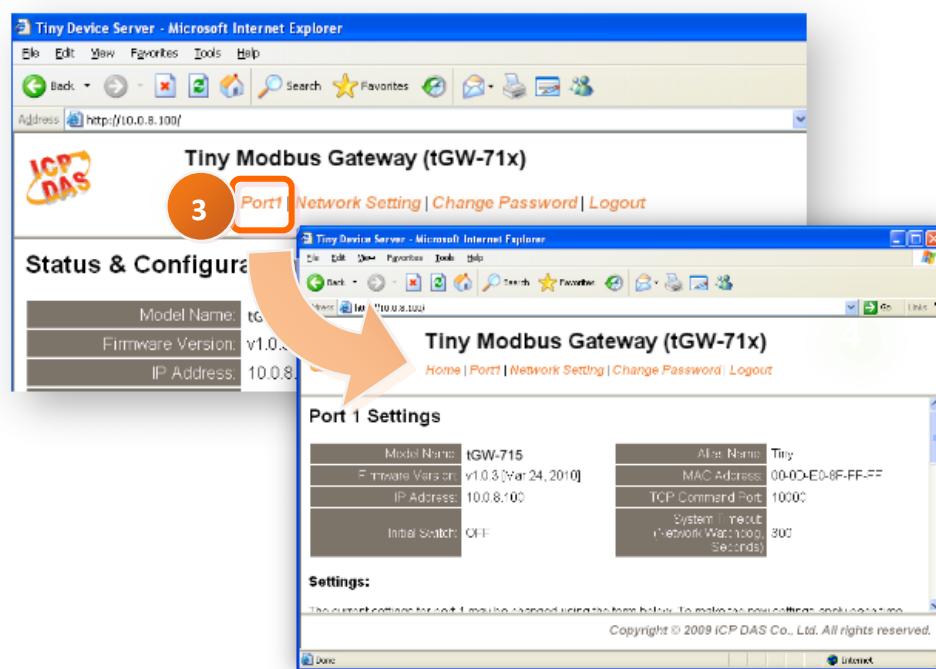

Figure 5-4

4. Select the appropriate **Baud Rate, Data Format and Modbus Protocol** settings from the relevant drop down options. The following is an example: Baud Rate (bps) “**115200**”, Data Bits (bits) “**8**”, Parity “**None**”, Stop Bits (bits) “**1**” and Modbus Protocol “**Modbus RTU**”.

Port Settings		Current	Updated
Baud Rate (bps)	115200	115200 ▾ bits/S	
Data Size (bits)	8	8 ▾ bits/character	
Parity	None	None ▾	
Stop Bits (bits)	1	1 ▾	
Slave Timeout (ms)	300	300 (Default: 300)	
Char Timeout (bytes)	4	4 (4 ~ 15, Default: 4)	
Silent Time (ms)	0	0 (0, 10, 20... 65530, Default: 0)	
Read Cache (ms)	980	980 (10, 20... 65530, Disable: 0)	
Local TCP Port	502	502 (Default: 502)	
TCP Timeout (seconds)	180	180 (1 ~ 65535, Default: 180, Disable: 0)	
Modbus Protocol	Modbus RTU	Modbus RTU ▾	

Figure 5-5

5. In the **Pair-connection Settings** area for Port1, check that the configuration details are the same as those shown below.

Field	Server Mode	Modbus Protocol	Remote Server IP	Remote TCP Port	TCP Slave ID (1~247)	RTU Slave ID (1~247)
<b>Pair-connection Settings</b>	<b>Client</b>	<b>TCP</b>	<b>10.0.8.246</b>	<b>502</b>	<b>0</b>	<b>0</b>

Modbus Protocol, IP address and TCP port for tGW-700 #2

6. Amend and details as required and then click the “**Submit**” button to complete the configuration.

Pair-Connection Settings (Master/Slave Mode)		Current	Updated
Server Mode	Server	Client ▾ (Server=Slave, Client=Master)	
Modbus Protocol	TCP	TCP ▾	
Remote Server IP	Disabled	10 . 0 . 8 . 246	
Remote TCP Port	Disabled	502	
RTU Slave ID (1~247)	0	0 (0: Bypass, No check)	
TCP Slave ID (1~247)	0	0 (0: Same as RTU)	
		<b>Submit</b>	

Figure 5-6

#### Step 4: Configuring the Pair-connection (Server Mode) on the Web Server for tGW-700 #2

1. In the eSearch Utility, click the name of the second tGW-715 module (tGW-700 #2) to select it, and then click the “**Web**” button to launch a browser window to connect to the web server on the tGW-700 #2 module. Alternatively, you can enter the URL for tGW-700 #2 in the address bar of the browser.
2. When the login screen is displayed, enter the password (use the default password “**admin**”) in the Password field, and then click the “**Submit**” button to display the configuration page.
3. Click the “**Port1**” tab to display the **Port1 Settings** page.
4. Select the appropriate **Baud Rate, Data Format and Modbus Protocol** settings from the relevant drop down options. The following is an example: Baud Rate (bps) “**9600**”, Data Bits (bits) “**8**”, Parity “**None**”, Stop Bits (bits) “**1**” and Modbus Protocol “**Modbus RTU**”.

※ Refer to [Figures 5-3 to 5-5](#) for an illustration of how to perform Steps 4-1 to 4-3 of the procedure described above.

5. In the **Pair-connection Settings** area for Port1, select “**Server**” from the “**Server Mode**” drop down options.
6. Amend any details as required and then click the “**Submit**” button to complete the configuration.

<b>Pair-Connection Settings (Master/Slave Mode)</b>		Current	Updated
Server Mode	Server	<input style="width: 100%;" type="button" value="Server ▾ (Server=Slave, Client=Master)"/>	
Modbus Protocol	TCP	<input type="button" value="TCP ▾"/>	
Remote Server IP	Disabled	<input type="text" value="10.0.8.244"/> . <input type="text" value="0"/> . <input type="text" value="8"/> . <input type="text" value="244"/>	
Remote TCP Port	Disabled	<input type="text" value="502"/>	
RTU Slave ID (1~247)	0	<input type="text" value="0"/> (0: Bypass, No check)	
TCP Slave ID (1~247)	0	<input type="text" value="0"/> (0: Same as RTU)	
<input style="border: 1px solid #ccc; padding: 2px; margin-right: 10px;" type="button" value="Submit"/>			

Figure 5-7

### Step 5: Testing the Pair-connection Functions

1. If necessary, install the Modbus Utility. Refer to [Chapter 3 Setting up the tGW-700 Module](#) for more details.
2. Open the Modbus Utility, and then click the “**Modbus/TCP**” button to select the controller.

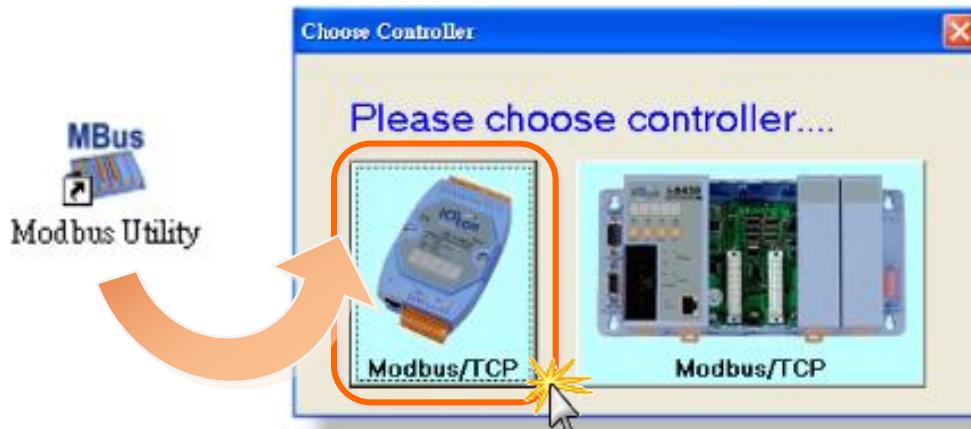

Figure 5-8

3. In the Modbus Utility, select the “**Modbus/RTU Client**” option from the “**Client tools**” menu.

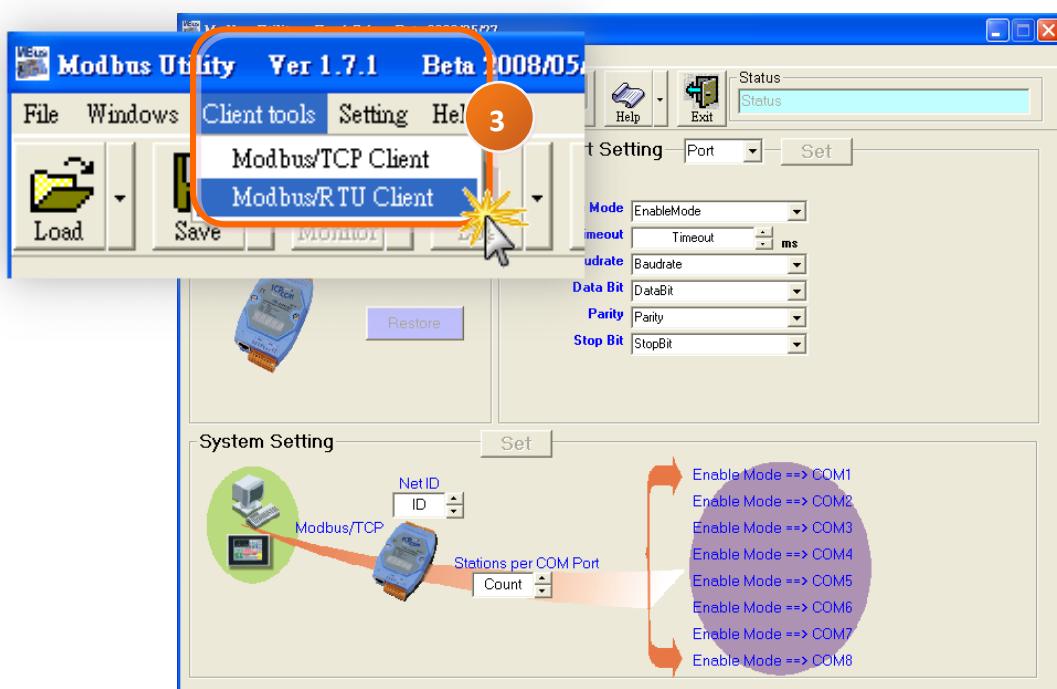

Figure 5-9

4. Select the appropriate COM port, Baud Rate and Data Format (e.g. COM1, 115200, N,8,1) settings for the tGW-700, and then click the “Open” button.

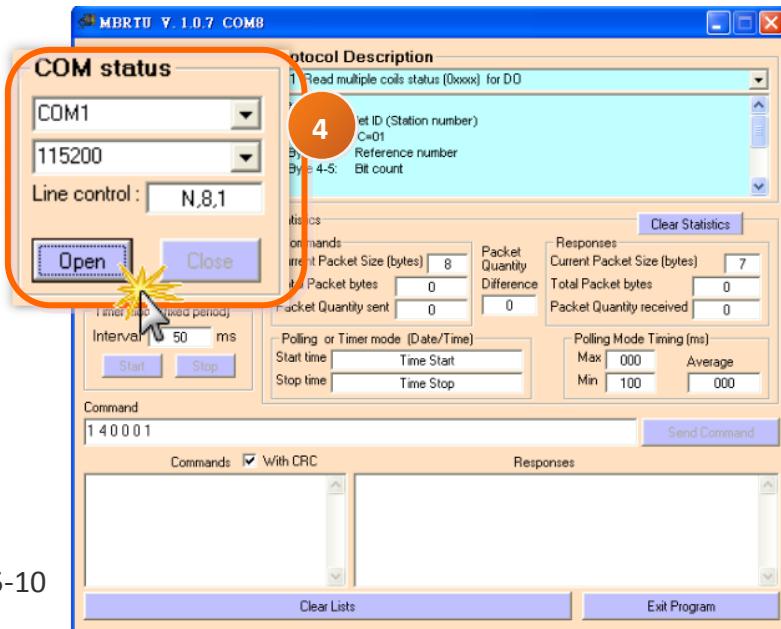

Figure 5-10

5. Refer to the “Protocol Description” field in the top right-hand section of the Modbus Utility window. You can send a request command and confirm the response is correct. (For example, if the remote Modbus device ID for the Modbus device (M-7055D) is 1, send the command “1 2 0 0 4” to reading D/I value, and the response shown in the “Responses” section will be “1 2 1 0 A1 88”. (Note that “A1 88” is the CRC value.)

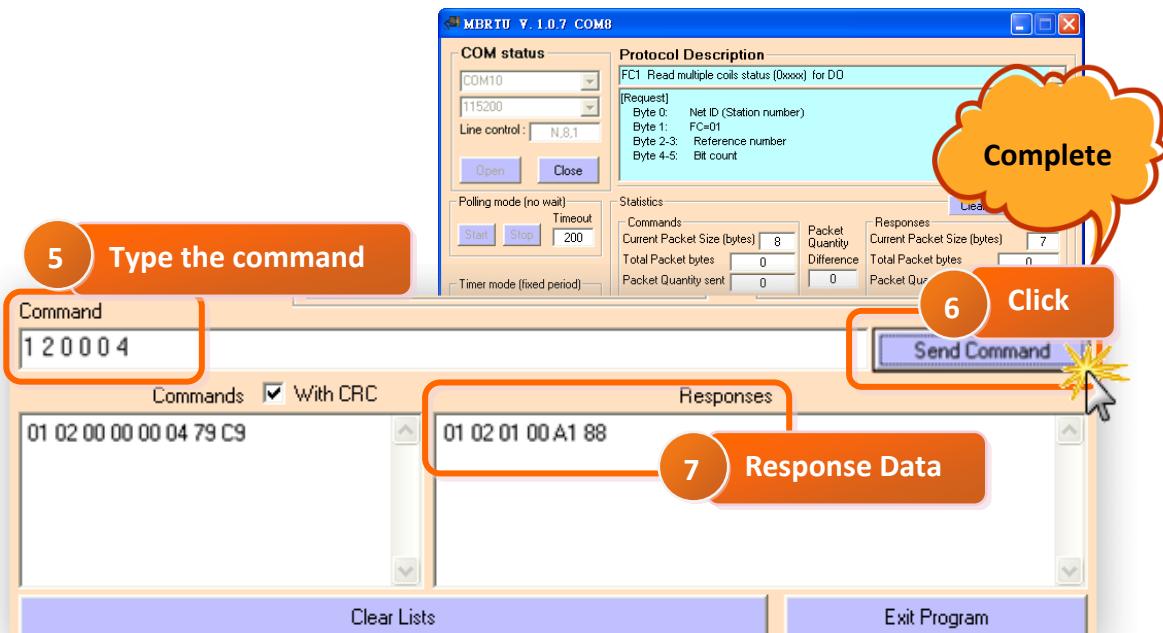

Figure 5-11

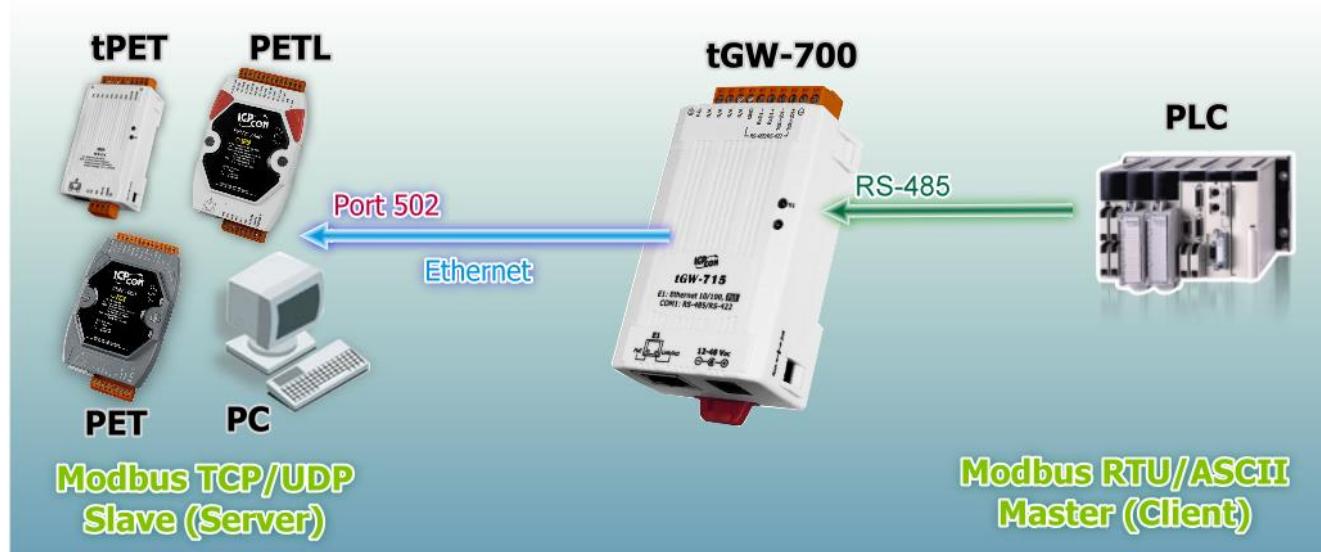

- Notes:**
1. The response will depend on which Modbus device is connected.
  2. The Baud Rate and Data Format values depend on the serial port settings configured for the web configuration described above.

## 5.4 TCP Client Mode Applications

In TCP Client Mode, the tGW-700 can actively establish a TCP connection to a specific Modbus TCP slave device. An example of how the complete system should operate is shown below:

**The following are examples of TCP Client Mode tests:**

TCP Client Mode Settings:

Model	Port Settings (default)		Pair-connection Settings		
	Baud Rate	Data Format	Server Mode	Remote Server IP	Remote TCP Port
tGW-700	115200	8, N, 1	Client	10.0.8.10	502
				IP address and TCP port for the tPET-P6 (Slave Device)	
tPET-P6 (Slave Device)	-	-	-	-	-

Follow the procedure described below:

**Step 1: Connecting to a network, a PC and a Power Supply**

1. Confirm that the tGW-700 device is functioning correctly. For detailed information regarding how to install, configure and operate your tGW-700 series module, refer to [Chapter 3 Setting up the tGW-700 Module](#).
2. Connect both the tGW-700, the Slave Device (e.g. a tPET-P6 module) and your computer to the same sub network or the same Ethernet Switch. For detailed information regarding RS-232/RS-422/485 wiring, refer to [Section 2.7 Wiring Notes for RS-232/422/485](#).

The wiring diagram is as follows:

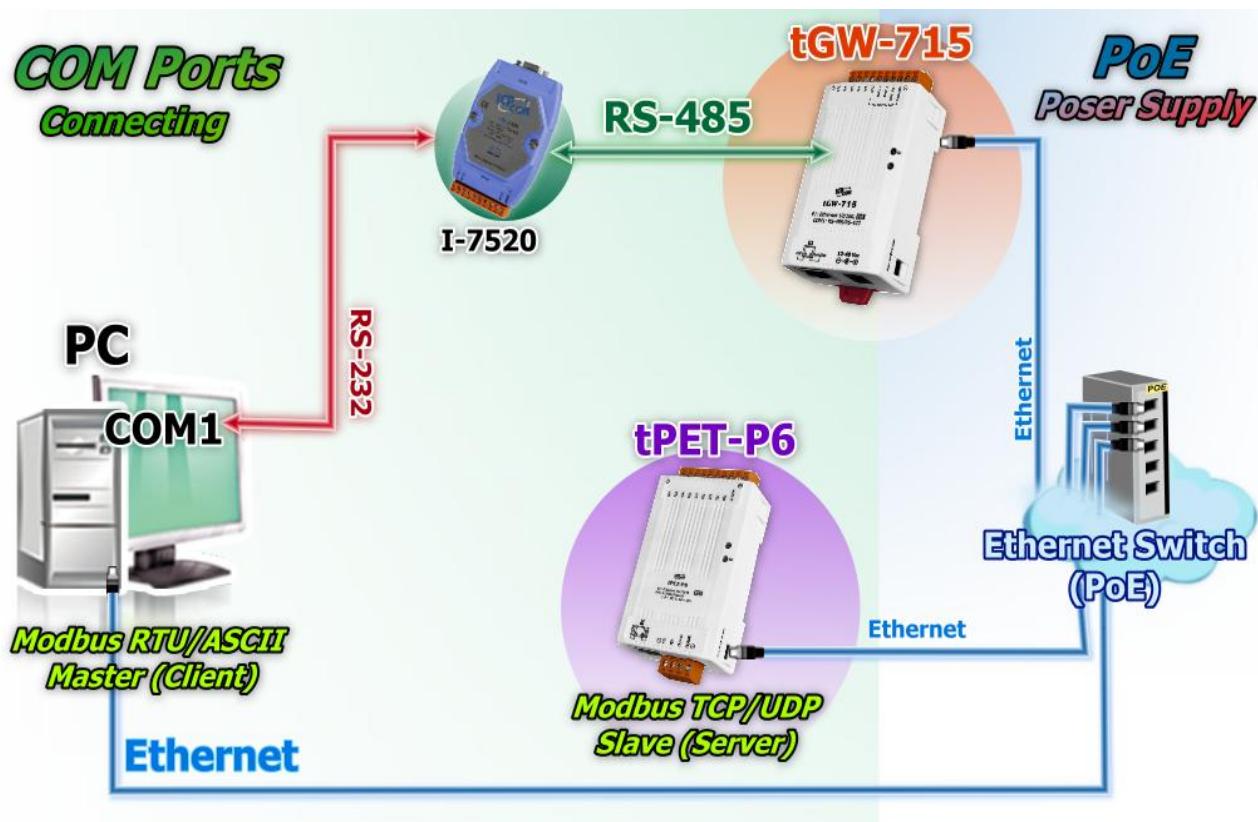

Figure 5-12

## Step 2: Configuring The Ethernet Settings

Contact your Network Administrator to obtain a correct and functioning network configuration (including the **IP Address, Mask and Gateway details**) for the tGW-700 module. Also refer to [Chapter 3 Setting up the tGW-700 Module](#) for more details.

Name	Alias	IP Address	Sub-net Mask	Gateway	MAC Address	DHC
tGW-715	0457	10.0.8.100	255.255.255.0	10.0.8.254	00:0d:e0:80:09:2f	OFF
tPET-P6	0457	10.0.8.10	255.255.255.0	10.0.8.254	00:0d:e0:64:4c:d3	OFF

Figure 5-13

## Step 3: Configuring Pair-connection (TCP Client Mode) on the Web Server for the tGW-700 module

1. Open the eSearch Utility to search for the tGW-700 modules connected to the network. Click the name of the first tGW-700 module to select it, and then click the “**Web**” button to launch a browser window to connect to the web server on the tGW-700 module. Alternatively, you can enter the URL for tGW-700 in the address bar of the browser.
2. When the login screen is displayed, enter the password (**use the default password “admin”**) in the Password field, and then click the “**Submit**” button to display the configuration page.

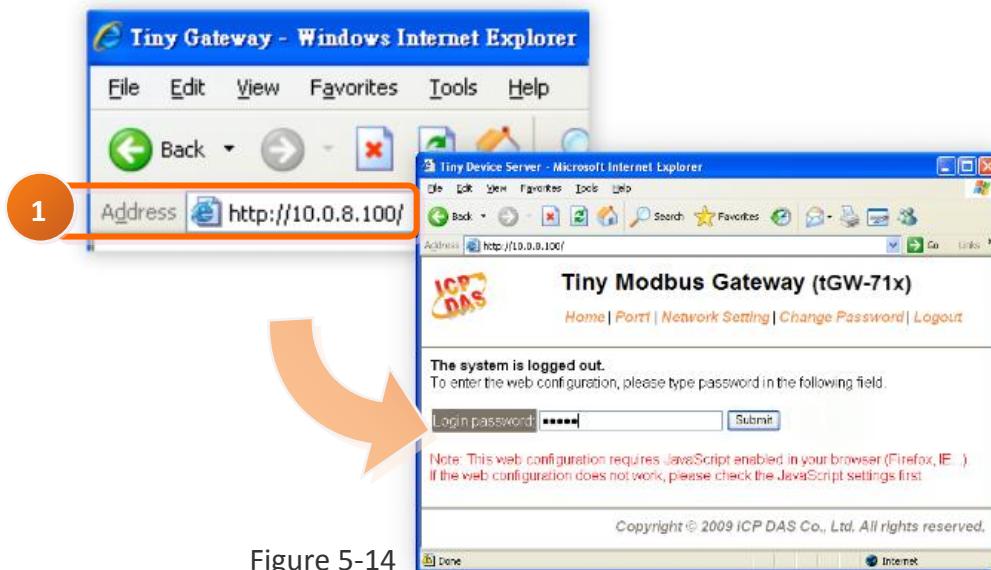

Figure 5-14

2. Click the “**Port1**” tab to display the **Port1 Settings** page.

The screenshot shows two windows side-by-side. The left window is titled "Modbus Gateway (tGW-71x)" and displays "Status & Configuration" with fields for Model Name (tGW-7), Firmware Version (v1.0.3), and IP Address (10.0.8.1). The right window is also titled "Modbus Gateway (tGW-71x)" and shows the "Port 1 Settings" page. This page includes fields for Model Name (tGW-715), Firmware Version (v1.0.3 [Ver 24, 2010]), IP Address (10.0.8.100), and Initial Watch (OFF). It also lists system information like MAC Address (00-0D-E0-0F-FF-FF), TCP Command Port (10000), System Timeout (300), and Network Watchdog (300 seconds). A large orange arrow points from the left window to the right window. A red circle with the number '2' is drawn around the "Port1" tab in the top navigation bar of the right window.

Figure 5-15

3. Select the appropriate Baud Rate, Data Format and Modbus Protocol settings from the relevant drop down options. The following is an example: Baud Rate (bps) “**115200**”, Data Bits (bits) “**8**”, Parity “**None**”, Stop Bits (bits) “**1**” and Modbus Protocol “**Modbus RTU**”.

Port Settings	Current	Updated
Baud Rate (bps)	115200	115200 ▾ bits/S
Data Size (bits)	8	8 ▾ bits/character
Parity	None	None ▾
Stop Bits (bits)	1	1 ▾
Slave Timeout (ms)	300	300 (Default: 300)
Char Timeout (bytes)	4	4 (4 ~ 15, Default: 4)
Silent Time (ms)	0	0 (0, 10, 20... 65530, Default: 0)
Read Cache (ms)	980	980 (10, 20... 65530, Disable: 0)
Local TCP Port	502	502 (Default: 502)
TCP Timeout (seconds)	180	180 (1 ~ 65535, Default: 180, Disable: 0)
Modbus Protocol	Modbus RTU	Modbus RTU ▾

Figure 5-16

4. In the **Pair-connection Settings** area of the Port1 Settings page, check that the configuration details are the same as those shown below.

Field	Server Mode	Modbus Protocol	Remote Server IP	Remote TCP Port	TCP Slave ID (1~247)	RTU Slave ID (1~247)
<b>Pair-Connection Settings</b>	<b>Client</b>	<b>TCP</b>	<b>10.0.8.10</b>	<b>502</b>	<b>0</b>	<b>0</b>
Modbus Protocol, IP address and TCP port of the slave device (e.g. tPET-P6)						

5. Amend any details as required and then click the “**Submit**” button to complete the configuration.

Pair-Connection Settings (Master/Slave Mode)		Current	Updated
Server Mode	Server	<input type="button" value="Client ▾"/> (Server=Slave, Client=Master)	
Modbus Protocol	TCP	<input type="button" value="TCP ▾"/>	
Remote Server IP	Disabled	<input type="text" value="10"/> . <input type="text" value="0"/> . <input type="text" value="8"/> . <input type="text" value="10"/>	
Remote TCP Port	Disabled	<input type="text" value="502"/>	
RTU Slave ID (1~247)	0	<input type="text" value="0"/> (0: Bypass, No check)	
TCP Slave ID (1~247)	0	<input type="text" value="0"/> (0: Same as RTU)	
<input type="button" value="Submit"/>			

Figure 5-17

※ Refer to [Figures 5-17](#) for an illustration of how to perform the procedure described above.

#### Step 4: Testing the Pair-connection (TCP Client Mode) Functions

※ For more detailed information regarding the testing procedure, refer to [Step 5 \(Figures 5-8 to 5-11\)](#) in [Section 5.3 Pair-Connection Applications](#).

# Appendix A: Glossary

## 1. ARP (Address Resolution Protocol)

The Address Resolution Protocol (ARP) is a telecommunication protocol that is used to convert an IP address to a physical address, such as an Ethernet address.

Consider two machines A and B that share the same physical network. Each has an assigned IP address  $IP_A$  and  $IP_B$ , and a MAC address,  $MAC_A$  and  $MAC_B$ . The goal is to devise a low-level software application that hides the MAC addresses and allows higher-level programs to work only with the IP addresses. Ultimately, however, communication must be carried out by the physical networks using whatever MAC address scheme the hardware supplies.

Suppose machine A wants to send a packet to machine B across a physical network to which they are both attached, but A only has the Internet address for B,  $IP_B$ . The question arises: how does A map that address to the MAC address for B,  $MAC_B$ ?

ARP provides a method of dynamically mapping 32-bit IP address to the corresponding 48-bit MAC address. The term dynamic is used since the mapping is performed automatically and is normally not a concern for either the application user or the system administrator.

## 2. Clients and Servers

The client-server paradigm uses the direction of initiation to categorize whether a program is a client or server. In general, an application that initiates peer-to-peer communication is called a client. End users usually invoke client programs when they use network services.

By comparison, a server is any program that waits for incoming requests from a client program. The server receives a request from a client, performs the necessary actions and returns the result to the client.

### 3. Ethernet

The term Ethernet generally refers to a standard published in 1982 by Digital Equipment Corp., Intel Corp. and Xerox Corp. Ethernet is the most popular physical layer Local Area Network (LAN) technology in use today.

### 4. Firmware

Firmware is an embedded software program or set of instructions programmed on a device that provides the necessary instructions for how the device communicated with other computer hardware, and is located or stored in a semi-permanent storage area, e.g., ROM, EEPROM, or Flash memory. Firmware can often be updated by downloading a file from the manufacturer's web site or FTP.

### 5. Gateway

Computers that interconnect two networks and pass packets from one to the other are called Internet Gateways or Internet Routers. Gateways route packets that are based on the destination network, rather than the destination host.

### 6. ICMP (Internet Control Message Protocol)

ICMP provides a method of communicating between the Internet Protocol software on one machine and the corresponding software on another. It allows a gateway to send error or control messages to other gateways, or allows a host to diagnose problems with the network communication.

### 7. Internet

Physically, the Internet is a collection of packet switching networks interconnected by gateways that together with the TCP/IP protocol, allows them to perform logically as a single, large and virtual network. The Internet recognizes hosts using 32-bit IP address.

## 8. IP (Internet Protocol) Address

Each interface on the Internet must have a unique IP address (also called an Internet address). These addresses are 32-bit numbers, and are normally written as four decimal numbers, one for each byte of the address for example “192.168.41.1”. This is called dotted-decimal notation.

## 9. MAC (Media Access Control) Address

To allow a computer to determine which packets are meant for it, each device attached to an Ethernet network is assigned a 48-bit integer known as its MAC address (also called the Ethernet address, the hardware address or the physical address). A MAC address is normally written as eight hexadecimal numbers, for example “**00:71:88:af:12:3e:0f:01**”. Ethernet hardware manufacturers purchase blocks of MAC addresses and assign them in sequence as they manufacture Ethernet interface hardware. Thus, no two hardware interfaces can have the same MAC address.

## 10. Packet

A packet is the unit of data sent across a physical network. It consists of a series of bits containing data and control information, including the source and the destination node (host) address, and is formatted for transmission from one node to another.

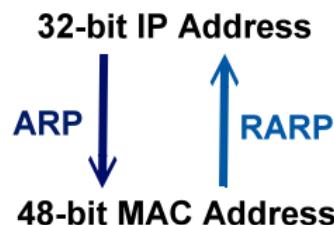

## 11. Ping

Ping is a network administration utility used to test whether a host on an Internet network is active, and to measure the round-trip time for messages sent from the originating host to a destination computer. Ping operates by sending an ICMP echo request message to a host, expecting an ICMP echo reply to be returned. Normally, if a host cannot be pinged, Telnet or FTP cannot be used to connect to the host. Conversely, if Telnet or FTP cannot be used to connect to a host, Ping is often the starting point to determine the nature of the problem.

## 12. RARP (Reverse Address Resolution Protocol)

RARP provides a method of dynamically mapping 48-bit MAC address to the corresponding 32-bit IP address. RARP has now been replaced by the Bootstrap Protocol (BOOTP) and the modern Dynamic Host Configuration Protocol (DHCP).

## 13. Socket

Each TCP segment contains a source and destination port number that can be used to identify the sending and receiving application. These two values, along with the source and destination IP addresses in the IP header, uniquely identify each connection. The combination of an IP address and a port number is called a socket.

## 14. Subnet Mask

A Subnet mask, often simply called the “Mask”, is a 32-bit number that masks and IP address, and divides the IP address into the network address and the host address. Given its own IP address and its subnet mask, a host can determine whether a TCP/IP packet is destined for a host that is (1) on its own subnet, or (2) on a different network. If (1), the packet will be delivered directly; otherwise it, will be delivered via a gateway or a router.

## 15. TCP (Transmission Control Protocol)

TCP is a set of rules used in combination with the Internet Protocol to send data in the form of message units between computers over the Internet. TCP provides a reliable flow of data between two hosts and is associated with tasks such as dividing the data passed to it from an application into appropriately sized chunks for the network layer below, acknowledging received packets, setting timeouts to make certain that the other end acknowledges packets that are sent, and so on.

## 16. TCP/IP

The Transmission Control Protocol (TCP) and the Internet Protocol (IP) are standard network protocols that are almost always implemented and used together in a formation known as TCP/IP. TCP/IP can be used to communicate across any set of interconnected networks.

## 17. UDP (User Datagram Protocol)

UDP is an internet protocol that provides a much simpler service to the application layer as it only sends packets of data from one host to another, but there is no guarantee that the packets will reach the destination host. UDP is suitable for purposes where error checking and correction is either not necessary or is performed in the application.

## Appendix B: Actual Baud Rate Measurement

Ideal Baud Rate (bps)	Actual Baud Rate (bps)	Error
50	50	0.00%
110	109.92	0.07%
300	298.48	0.51%
600	597.04	0.49%
1200	1197.6	0.20%
2400	2395.2	0.20%
4800	4790.4	0.20%
9600	9568.0	0.33%
14400	14392	0.05%
19200	19136	0.33%
38400	38464	0.17%
57600	57552	0.08%
115200	114960	0.21%
128000	128240	0.18%
230400	229920	0.21%
250000	250000	0.00%
256000	256400	0.15%
460800	459760	0.22%
921600	921600	0.00%

**Note: Recommended max baud rate is 115200 bps or below.**

**Because the loading of the module, we don't guarantee a proper operation if using a larger baud rate (over 115200 bps).**

## Appendix C: Exception Codes

If an exception occurs during Modbus communication, the slave device will return an Exception Code in the response message. The following is an explanation of the Exception Codes:

### ➤ Exception Codes:

Code	Name and Description
0x01	<b>ILLEGAL_FUNCTION</b> Indicates that the function code received in the query is not an allowable action for the slave. If not an allowable action for the slave. If a Poll Program Complete command was issued, this code indicates that no program function preceded it.
0x02	<b>ILLEGAL_DATA_ADDRESS</b> Indicates that the data address received in the query is not an allowable address for the slave.
0x03	<b>ILLEGAL_DATA_VALUE</b> Indicates that a value contained in the query data field is not an allowable value for the slave.
0x04	<b>SLAVE_DEVICE_FAILURE</b> Indicates that an unrecoverable error occurred while the slave was attempting to perform the requested action.
0x05	<b>ACKNOWLEDGE</b> Indicates that the slave has accepted the request and is processing it, but it will take an extended period of time to do so. This response is returned to prevent a timeout error from occurring in the master. The master can issue a Poll Program Complete message later to determine whether the processing is complete.
0x06	<b>SLAVE_DEVICE_BUSY</b> Indicates that the slave is engaged in processing a long-duration program command. The master should retransmit the message later when the slave is free.
0x07	<b>NEGATIVE_ACKNOWLEDGE</b> Indicates that the extended file area failed to pass a consistency check, and the slave cannot perform the program function received in the query. This code is returned when a programming request using function code 13 or 14 decimal was unsuccessful. The master should request diagnostic or error information from the slave.

0x08	<b>MEMORY_PARITY_ERROR</b>
	Indicates that the slave attempted to read extended memory, but detected a parity error in the memory. The master can retransmit the request, but maintenance may be required on the slave device.

### ➤ Defined Exception Codes for tGW-700:

Code	Name and Description
0x03	<b>ILLEGAL_DATA_VALUE</b> The Modbus request parameters are incomplete.
0x06	<b>DEVICE_BUSY</b> The tGW-700 will return this code when the Gateway busy or request buffer is full.
0x0B	<b>GATEWAY_TARGET_DEVICE_FAILED_TO_RESPOND</b> Timeout. The slave device does not respond within the timeout value, the tGW-700 will return this code.
0x4B	<b>GATEWAY_TARGET_DATA_FAILED_TO_RESPOND</b> Timeout. The slave device is still sending data when timed out, the tGW-700 will return this code.
0x41	<b>MODBUS_PROTOCOL_FORMAT_ERROR</b> The tGW-700 will return this code when slave response is invalid Modbus message.
0x43 0x52	<b>CRC_ERROR</b>
